

# Artificial Intelligence: Knowledge Representation: Semantic

---

**CPSC 433: Artificial Intelligence  
Fall 2022**

Jonathan Hudson, Ph.D  
Assistant Professor (Teaching)  
Department of Computer Science  
University of Calgary

**Tuesday, November 22, 2022**

**UNIVERSITY OF  
CALGARY**

# Semantic Nets

---

- Developed to have (partial) **graphical** representation of predicate logic with special interpreted symbols
- First used to represent sentences in **natural language**
- Later abstracted to represent just **meanings** (Conceptual Dependency)
- Many different approaches (for example FIPA agent model)
- Sometimes used for describing ontologies
  - ☞ grows together with frames
- Often also coupled with a logic and the possibility to add formulas to description
- Models classes and instances

# Basic data structures

---

- Nodes:  
describe **concepts** and instantiations (objects, actions)
- Arcs/links:  
describe **dependencies**,  
like isa, is-element, greater-than,...  
can be predefined and user-defined
- Modifiers:  
add **constraints, roles**, etc. to links

# Semantics

---

- Provide **fixed** interpretations for as many links as possible
- Provide **fixed** interpretations for modifiers
- User defined links require way to define their semantics (e.g. axioms in a logic with already defined semantics, or other descriptions)

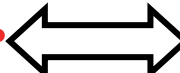

# Example: Conceptual Dependency (I)

---

- **Actors**: name or class name
- **Actions** (selection; including semantics)
  - ATRANS: Transfer of abstract relationship (give)
  - PTRANS: Transfer of physical location of object (go)
  - MOVE: Movement of body part by owner (kick)
  - INGEST: Ingesting of object by actor (eat)
  - MTRANS: Transfer of mental information (tell)
  - MBUILD: Building new information out of old (decide)

# Example: Conceptual Dependency (II)

---

- **Links:**
  -  relation between actor and action
  -  indicates dependency and direction of it
- **Modifiers** (selection; including semantics):  
for relations between actor and action:
  - p : past tense
  - f: future
  - nil: presentfor dependencies:
  - o: object of an action
  - R: recipient of object+ user-defined modifiers

# Example: Conceptual Dependency (II)

## ▶ Links

- relation between actor and action
- indicates dependency and direction of it

## • Actions (PRIMITIVE)

- *ATRANS*: Transfer of abstract relationship (give) -> recipient
- *PTRANS*: Transfer of physical location of object (go) -> recipient
- *MOVE*: Movement of body part by owner (kick)
- *INGEST*: Ingesting of object by actor (eat)
- *MTRANS*: Transfer of mental information (tell) -> recipient
- *MBUILD*: Building new information out of old (decide)

## ▶ Modifiers

### ▶ To link to action

- p : past tense
- f: future
- nil: present for dependencies:
- o: object of an action
- R: recipient of object

# How to get knowledge into the representation structure

---

- Knowledge engineer should use **as many predefined** concepts, links and modifiers **as possible** in his/her graphs
- Knowledge engineer has to provide semantics (procedural, descriptive) for all user defined concepts, links and modifiers

# Discussion

---

- Semantic nets express structure in a way also understandable by humans
- Easy to combine with other representation concepts
- Easily extendable
  - Problem with how to express semantics for user-defined elements
  - Some extensions are not decidable
  - Often the predefined elements are not what we want for an application

# And what about processing data?

---

- Answering questions:  
**match question graph** (with holes/variables) against graphs in knowledge base and return substitutions  
☞ search (for best match)
- Adding to existing knowledge-base (classification):  
**match new knowledge** against old and add new graph parts (while checking fulfillment of constraints)  
☞ search (for best fit)
- Other tasks:  
use provided procedures (based on semantics)  
for example: inference rules for conceptual dependency actions

# Examples

---

- Build a conceptual dependency representation for the following sentences:
  - John eats a steak
  - John ate pizza yesterday
- Build the graph for the following question and match it against the knowledge base from above:
  - Who had pizza yesterday?

# Examples

---

- Build a conceptual dependency representation for the following sentences:
  - John eats a steak
  - John ate pizza yesterday
- Build the graph for the following question and match it against the knowledge base from above:
  - Who had pizza yesterday?
- Actors
- Actions
- Links
- Modifiers

# Examples

---

- Build a conceptual dependency representation for the following sentences:
  - **John** eats a **steak**
  - **John** ate **pizza** yesterday
- Build the graph for the following question and match it against the knowledge base from above:
  - Who had **pizza** yesterday?
- Actors -> **John**, **Steak**, **Pizza**

# Examples

---

- Build a conceptual dependency representation for the following sentences:
  - John **eats** a steak
  - John **ate** pizza yesterday
- Build the graph for the following question and match it against the knowledge base from above:
  - Who had pizza yesterday?
- Actors -> John, Steak, Pizza
- Actions -> **INGEST**

# Examples

---

- Build a conceptual dependency representation for the following sentences:
  - **John eats a steak**
  - **John ate pizza** yesterday
- Build the graph for the following question and match it against the knowledge base from above:
  - Who had pizza yesterday?
- Actors -> John, Steak, Pizza
- Actions -> INGEST
- Links -> **john linked to object**

# Examples

---

- Build a conceptual dependency representation for the following sentences:
  - John eats a steak
  - John ate pizza **yesterday**
- Build the graph for the following question and match it against the knowledge base from above:
  - Who had pizza yesterday?
- Actors -> John, Steak, Pizza
- Actions -> INGEST
- Links -> john linked to object
- Modifiers -> **yesterday**

# Examples

---

- Build a conceptual dependency representation for the following sentences:
  - **John eats a steak**
  - John ate pizza yesterday
- Actors -> John, Steak, Pizza
- Actions -> INGEST
- Links -> john linked to object
- Modifiers -> yesterday

*John*  $\Leftrightarrow$  *INGEST*  $\leftarrow^0$  *Steak*

# Examples

---

- Build a conceptual dependency representation for the following sentences:
  - John eats a steak
  - **John ate pizza yesterday**
- Actors -> John, Steak, Pizza
- Actions -> INGEST
- Links -> john linked to object
- Modifiers -> **yesterday**

*John*  $\Leftrightarrow$  *INGEST*  $\leftarrow^0$  *Steak*  
*John*  $\Leftrightarrow^p$  *INGEST*  $\leftarrow^0$  *Pizza*

# Examples

---

- Build a conceptual dependency representation for the following sentences:
  - Who had **pizza** yesterday?
- Actors -> X
- Actions -> INGEST
- Links -> X linked to object
- Modifiers -> yesterday

$X \Leftrightarrow^p \text{INGEST} \leftarrow^o \text{Pizza}$

# Onward to ... Neural Networks
