

Self-Organized Criticality (SOC)

Tino Duong
Biological Computation

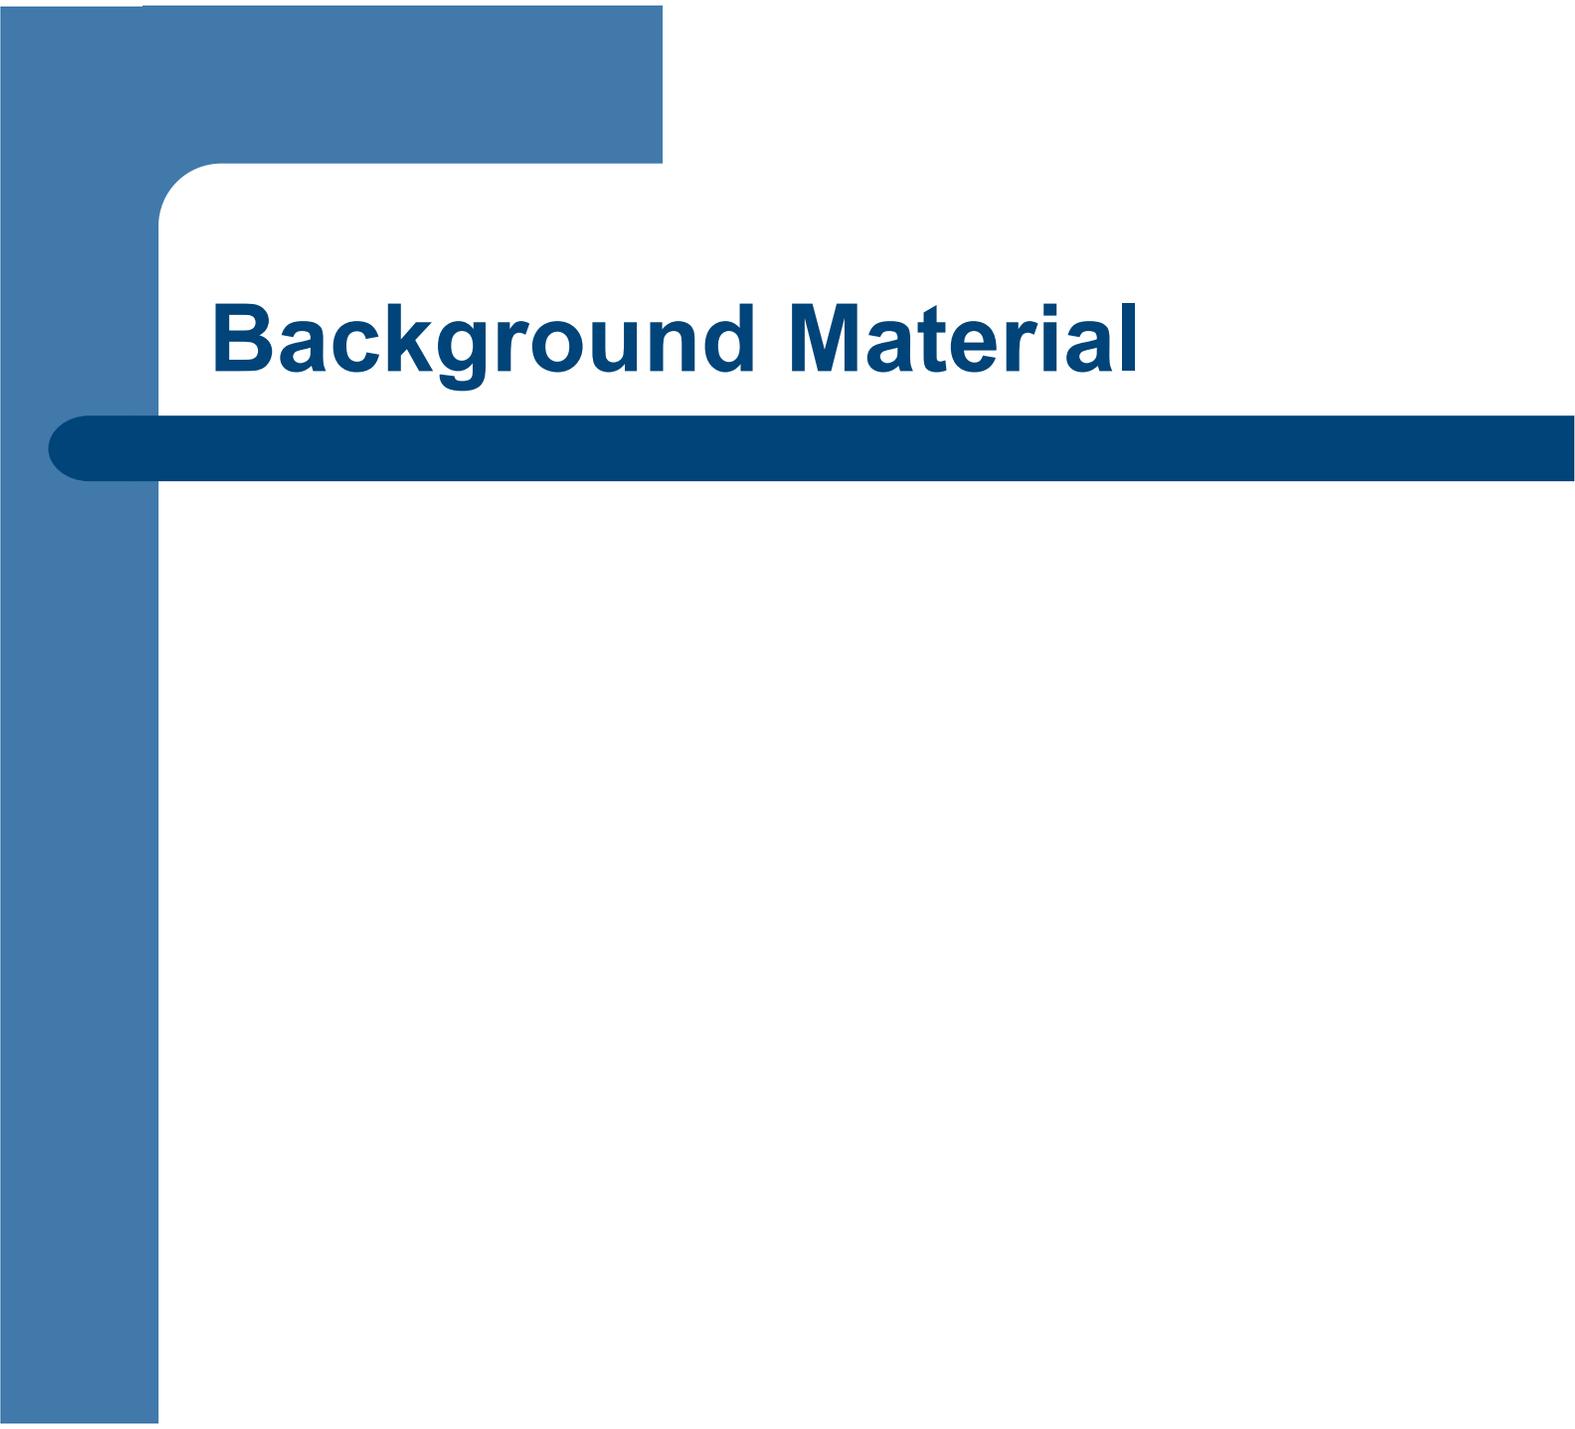

Agenda

- Introduction
- Background material
- Self-Organized Criticality Defined
- Examples in Nature
- Experiments
- Conclusion

SOC in a Nutshell

- Is the attempt to explain the occurrence of complex phenomena

A decorative graphic consisting of a blue L-shaped element on the left side of the page. The vertical bar is on the far left, and the horizontal bar extends to the right. The top-right corner of the L-shape is rounded. A thick, dark blue horizontal bar is positioned below the text, extending from the left edge of the page to the right edge.

Background Material

What is a System?

- A group of components functioning as a whole

Obey the Law!

- Single components in a system are governed by rules that dictate how the component interacts with others

System in Balance

- Predictable
- States of equilibrium
 - Stable, small disturbances in system have only local impact

Order

Chaos

Predictable

Systems in Chaos

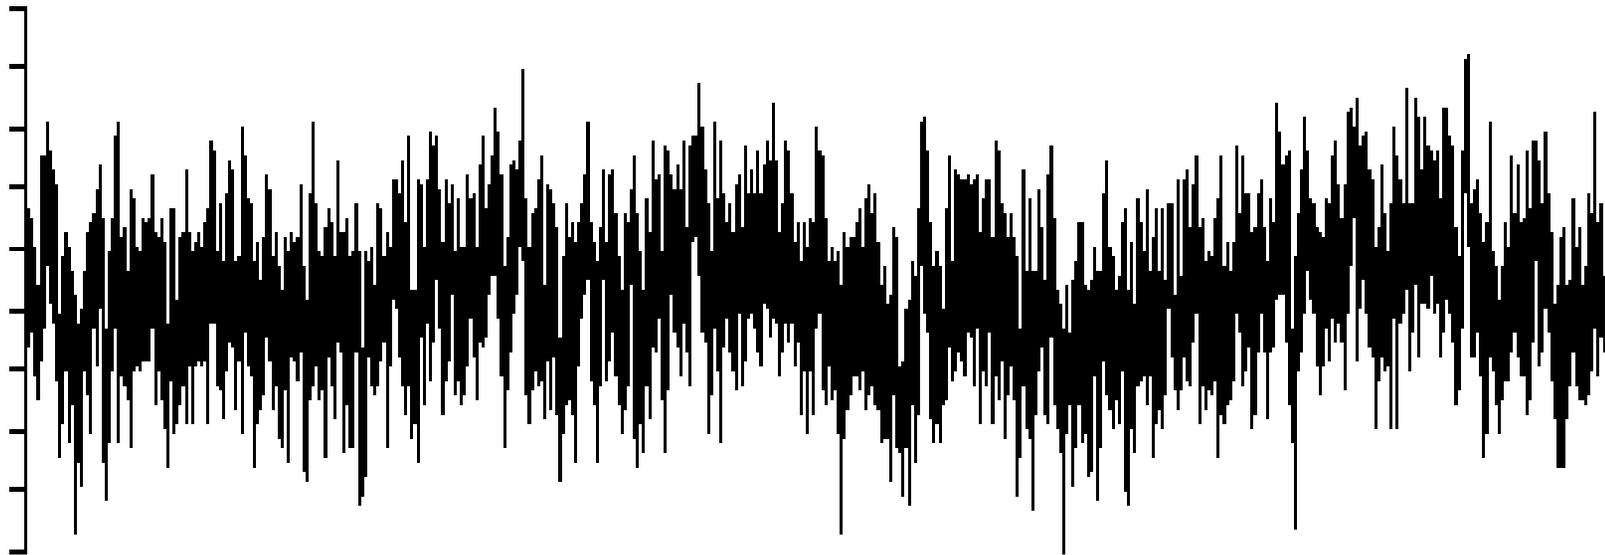

- Unpredictable
- Boring

Order

Chaos

Unpredictable

Example Chaos: White Noise

Edge of Chaos

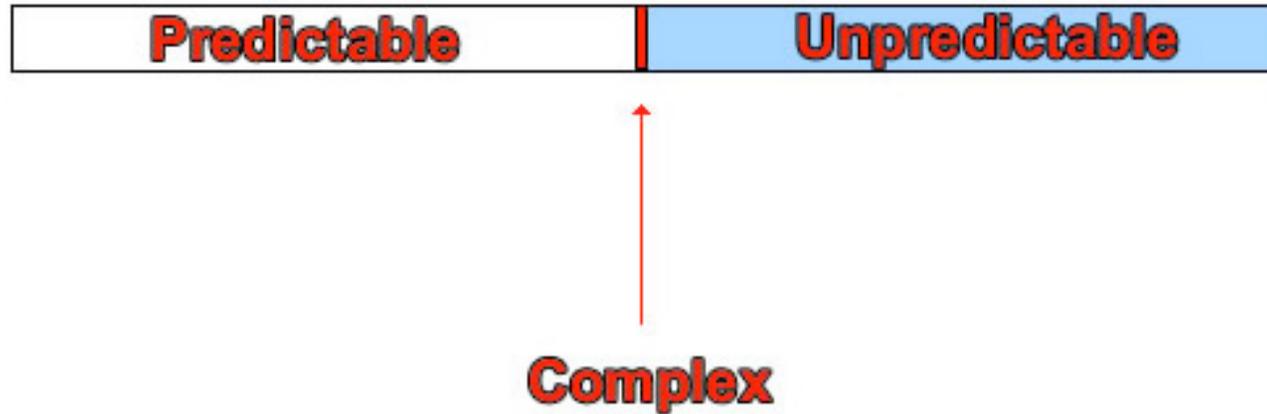

Order

Chaos

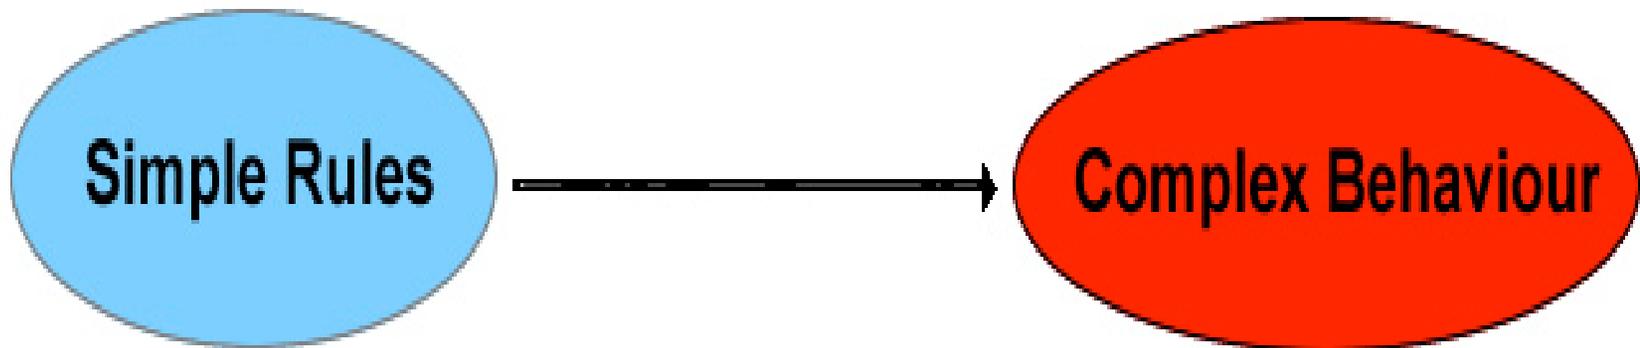

Predictable

Unpredictable

Complex

Emergent Complexity

Self-Organized Criticality

Self-Organized Criticality: Defined

- Self-Organized Criticality can be considered as a characteristic state of criticality which is formed by self-organization in a long transient period at the border of stability and chaos

Characteristics

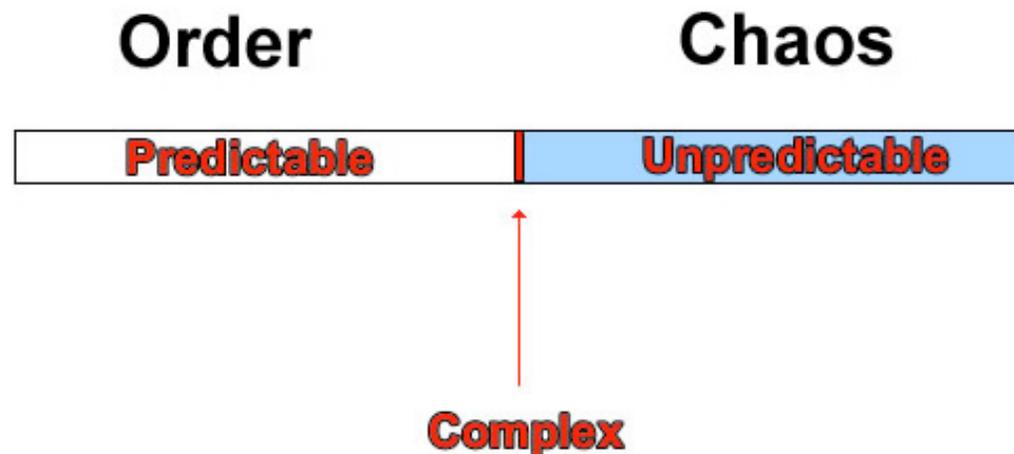

- Open dissipative systems
- The components in the system are governed by simple rules

Characteristics (continued)

- Thresholds exists within the system
- Pressure builds in the system until it exceeds threshold

Characteristics (Continued)

- Naturally Progresses towards critical state
 - Small agitations in system can lead to system effects called avalanches
 - This happens regardless of the initial state of the system

Domino Effect: System wide events

- The same perturbation may lead to small avalanches up to system wide avalanches

Example: Domino Effect

1	2	0	2	3
2	3	2	3	0
1	2	3	3	2
3	1	3	2	1
0	2	2	1	2

1	2	0	2	3
2	3	2	3	0
1	2	4	3	2
3	1	3	2	1
0	2	2	1	2

1	2	0	2	3
2	3	3	3	0
1	3	0	4	2
3	1	4	2	1
0	2	2	1	2

1	2	0	2	3
2	3	3	4	0
1	3	2	0	3
3	2	0	4	1
0	2	3	1	2

1	2	0	3	3
2	3	4	0	1
1	3	2	2	3
3	2	1	0	2
0	2	3	2	2

1	2	1	3	3
2	4	0	1	1
1	3	3	2	3
3	2	1	0	2
0	2	3	2	2

1	3	1	3	3
3	0	1	1	1
1	4	3	2	3
3	2	1	0	2
0	2	3	2	2

1	3	1	3	3
3	1	1	1	1
2	0	4	2	3
3	3	1	0	2
0	2	3	2	2

1	3	1	3	3
3	1	2	1	1
2	1	0	3	3
3	3	2	0	2
0	2	3	2	2

1	3	1	3	3
3				1
2				3
3	3			2
0	2	3	2	2

By: Bak [1]

Characteristics (continued)

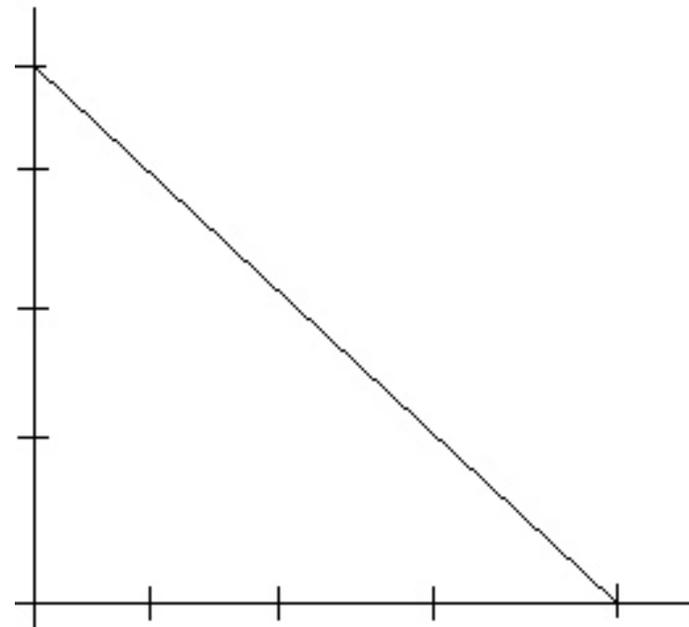

- Power Law
 - Events in the system follow a simple power law

$$N(s) = s^{-t}$$

Power Law: graphed

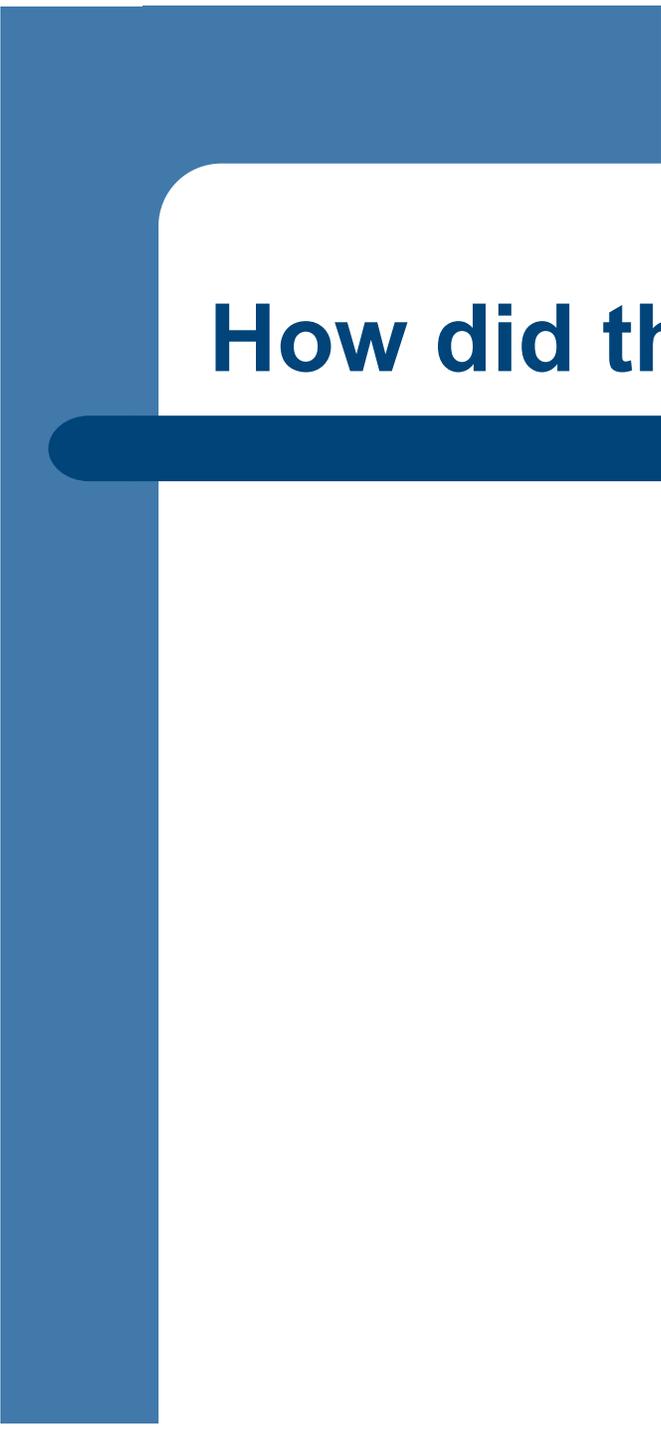

$$N(s) = s^{-t} \quad \text{i)}$$

$$\log N(s) = -t \log s \quad \text{ii)}$$

Characteristics (continued)

- Most changes occurs through catastrophic event rather than a gradual change
 - Punctuations, large catastrophic events that effect the entire system

How did they come up with this?

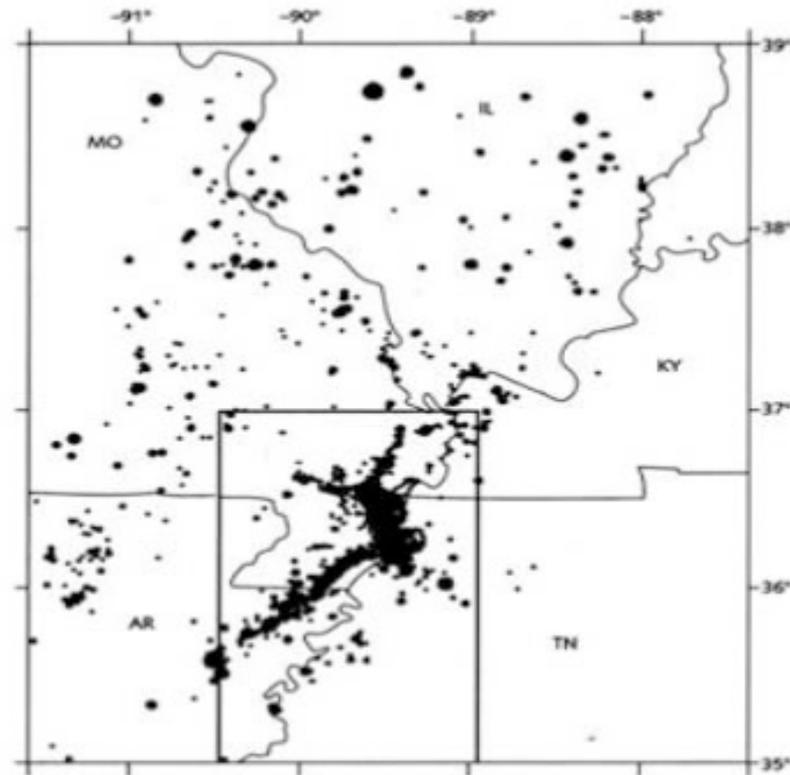

Nature can be viewed as a system

- It has many individual components working together
- Each component is governed by laws
 - e.g, basic laws of physics

Nature is full of complexity

- Gutenberg-Richter Law
- Fractals
- 1-over-f noise

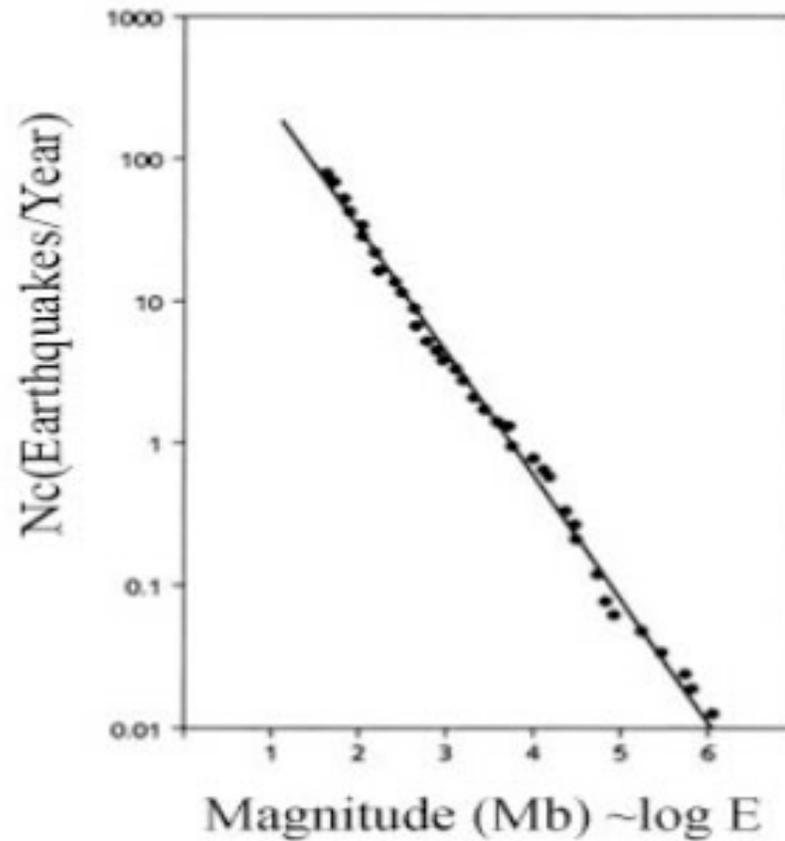

Earthquake distribution

1974-1983

By: Bak [1]

Gutenberg-Richter Law

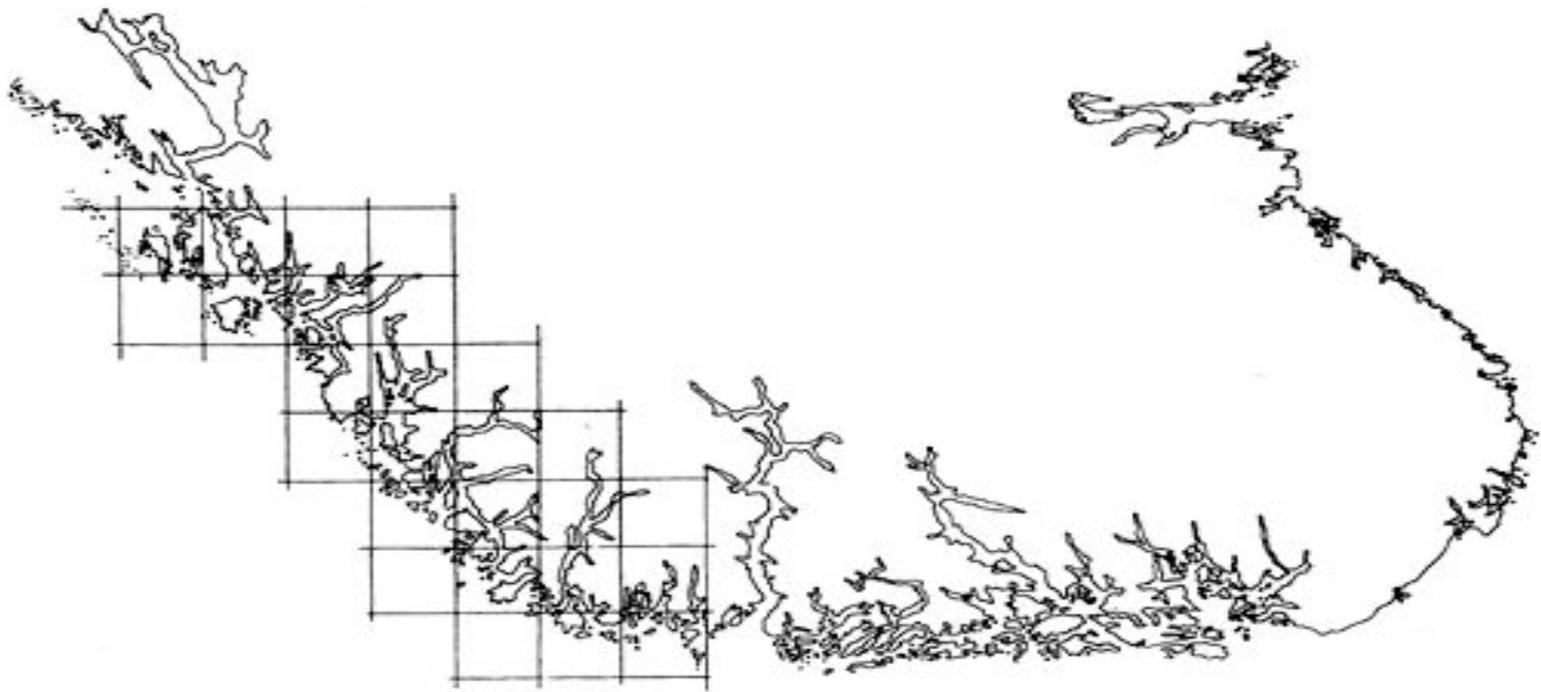

By: Bak [1]

Fractals:

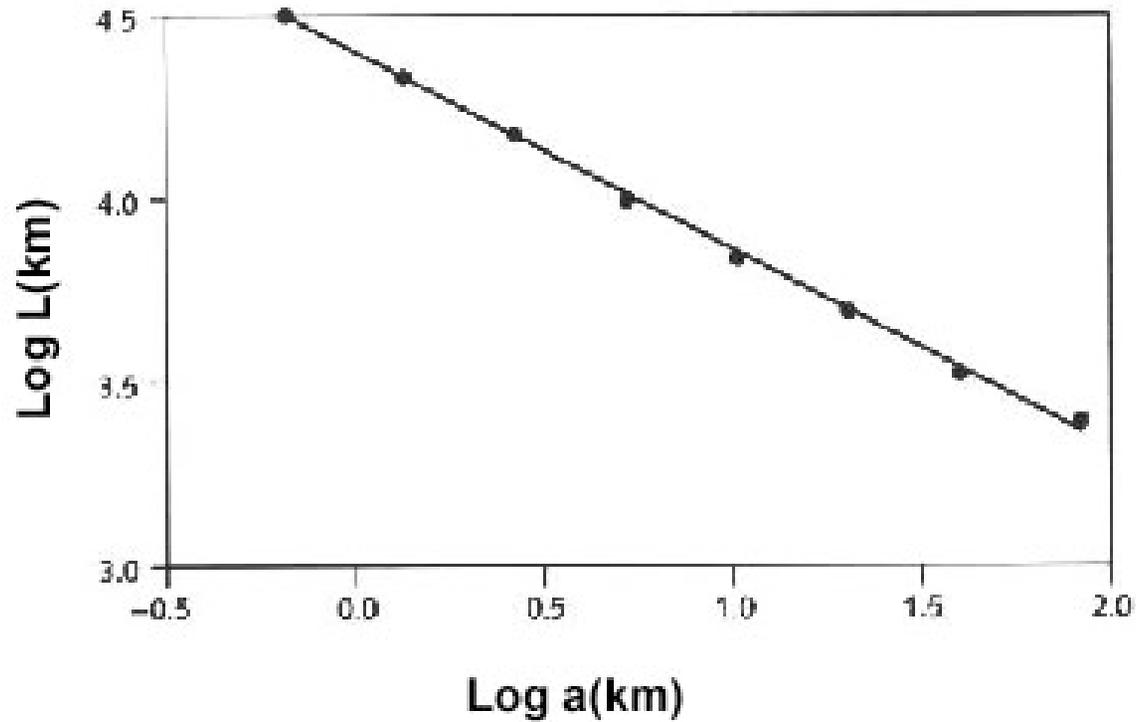

- Geometric structures with features of all length scales (e.g. scale free)
 - Ubiquitous in nature
 - Snowflakes
 - Coast lines

Fractal: Coast of Norway

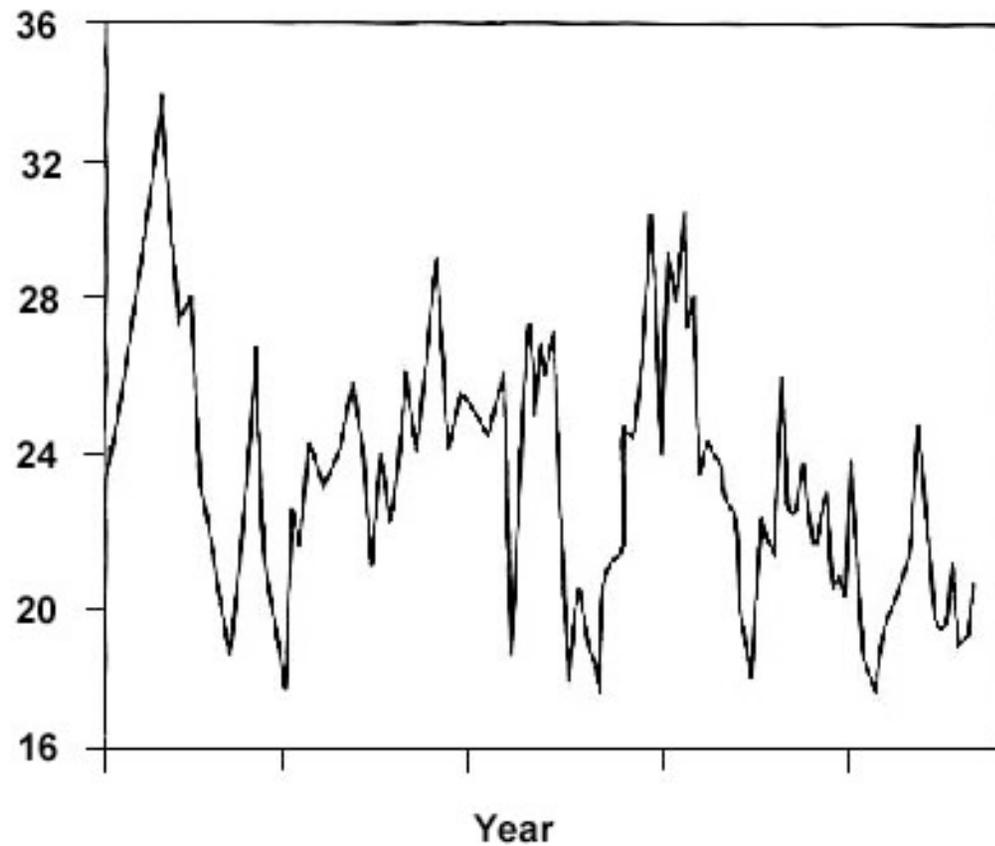

By: Bak [1]

Log (Length) Vs. Log (box size)

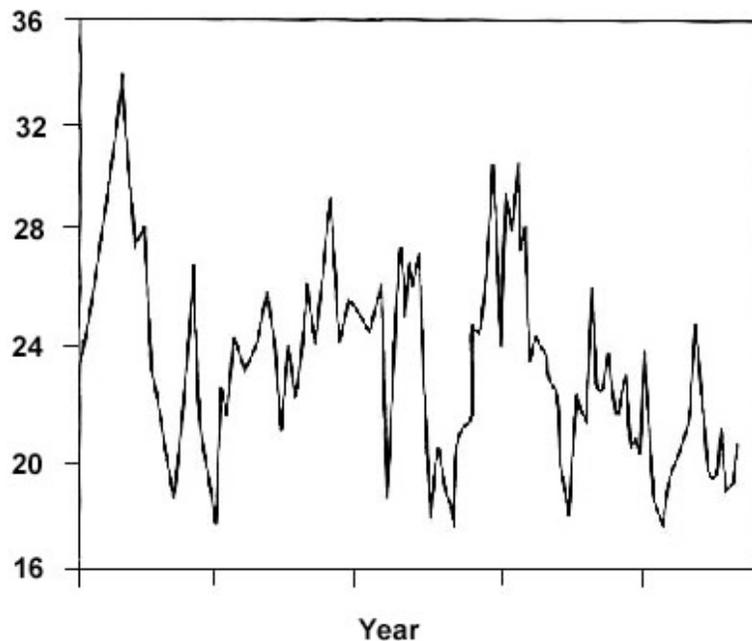

By: Bak [1]

1/F Noise

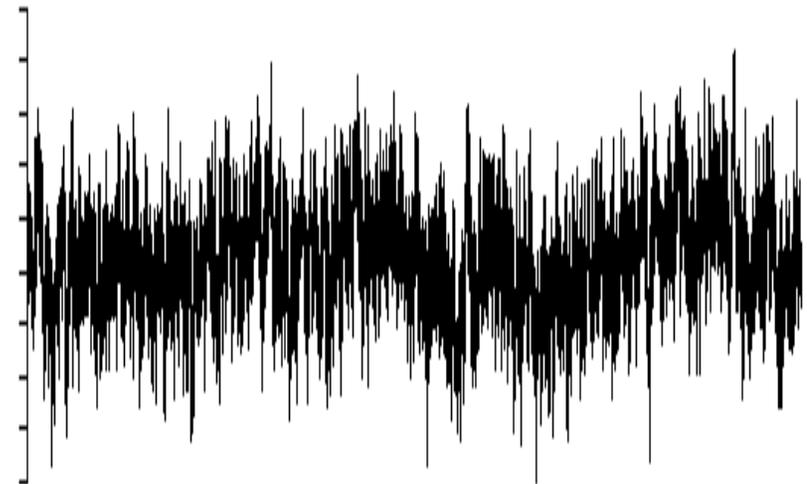

By: Bak [1]

1/f noise has interesting patterns

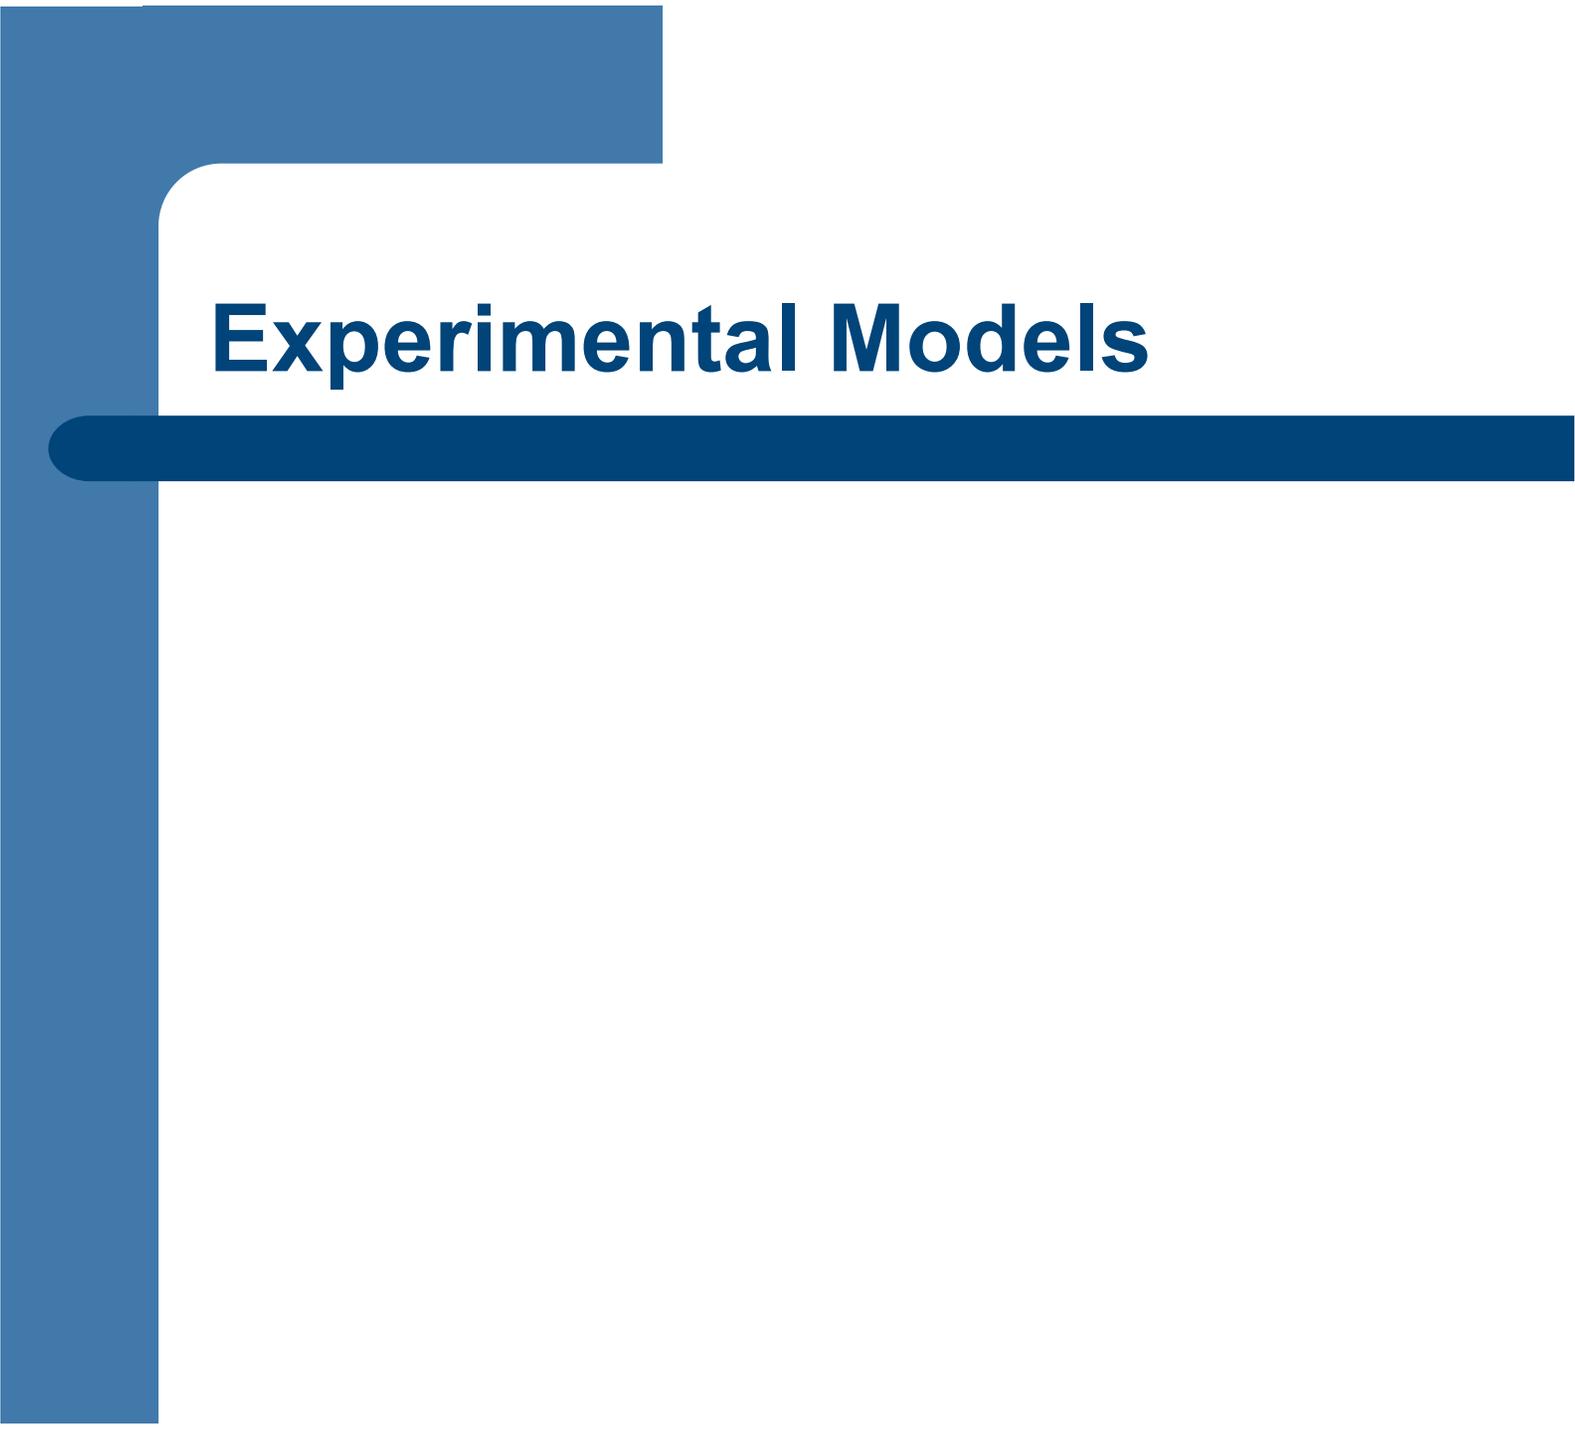

1/f Noise

White Noise

Can SOC be the common link?

- Ubiquitous phenomena
 - No self-tuning
 - Must be self-organized
- Is there some underlying link

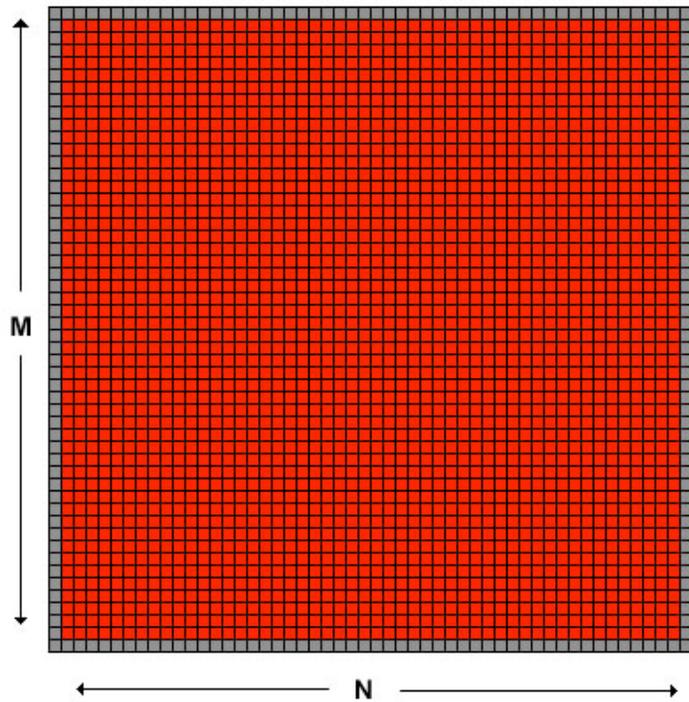

A decorative graphic consisting of a blue L-shaped element on the left side of the slide. The vertical bar is on the far left, and the horizontal bar extends to the right, ending in a rounded tip. The text "Experimental Models" is positioned to the right of the vertical bar, overlapping the horizontal bar.

Experimental Models

Sand Pile Model

- An $M \times N$ grid Z
- Energy enters the model by randomly adding sand to the model
- We want to measure the avalanches caused by adding sand to the model

Example Sand pile grid

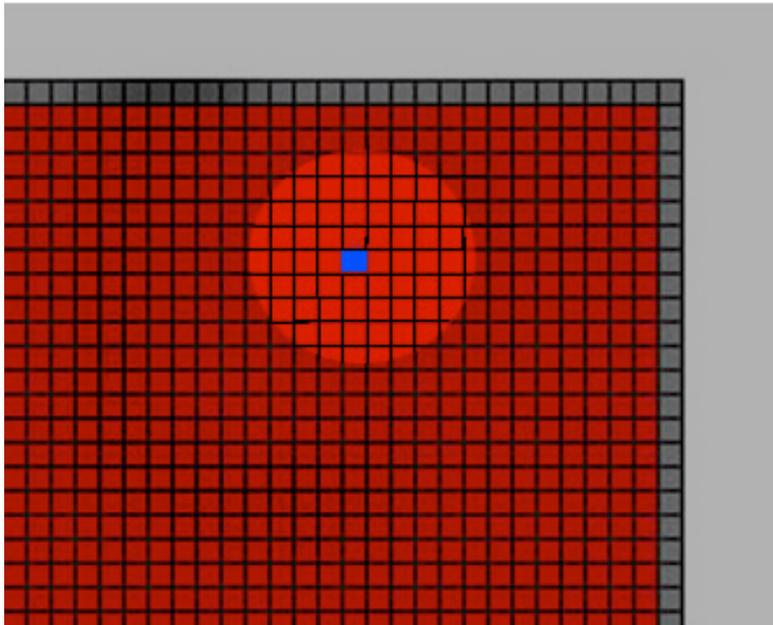

- Grey border represents the edge of the pile
- Each cell, represents a column of sand

Model Rules

- Drop a single grain of sand at a random location on the grid
 - Random (x,y)
 - Update model at that point: $Z(x,y) \rightarrow Z(x,y)+1$
- If $Z(x,y) > \text{Threshold}$, spark an avalanche
 - Threshold = 3

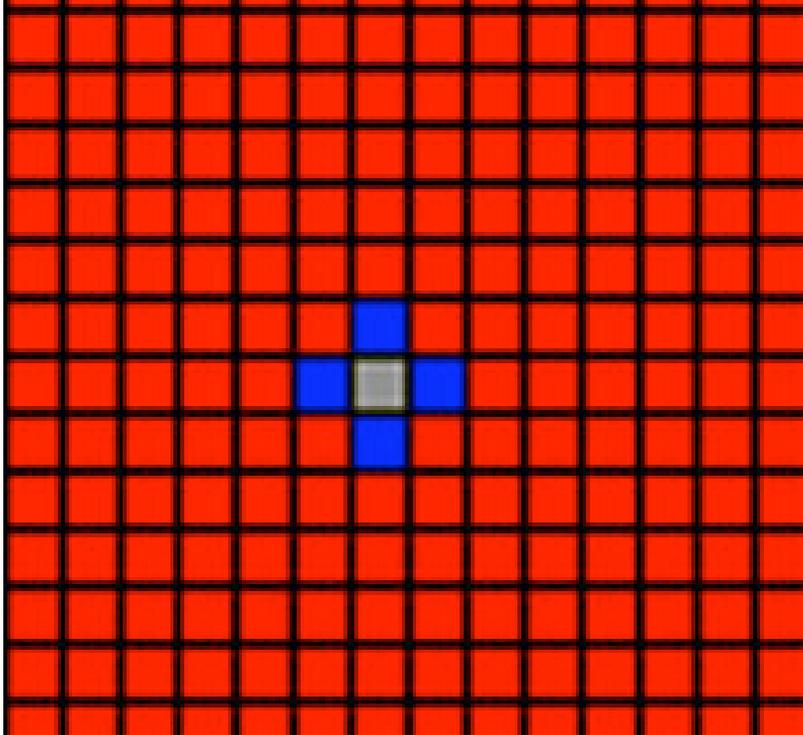

Adding Sand to pile

- Chose Random (x,y) position on grid
- Increment that cell
 - $Z(x,y) \rightarrow Z(x,y)+1$
- Number of sand grains indicated by colour code

By: Maslov [6]

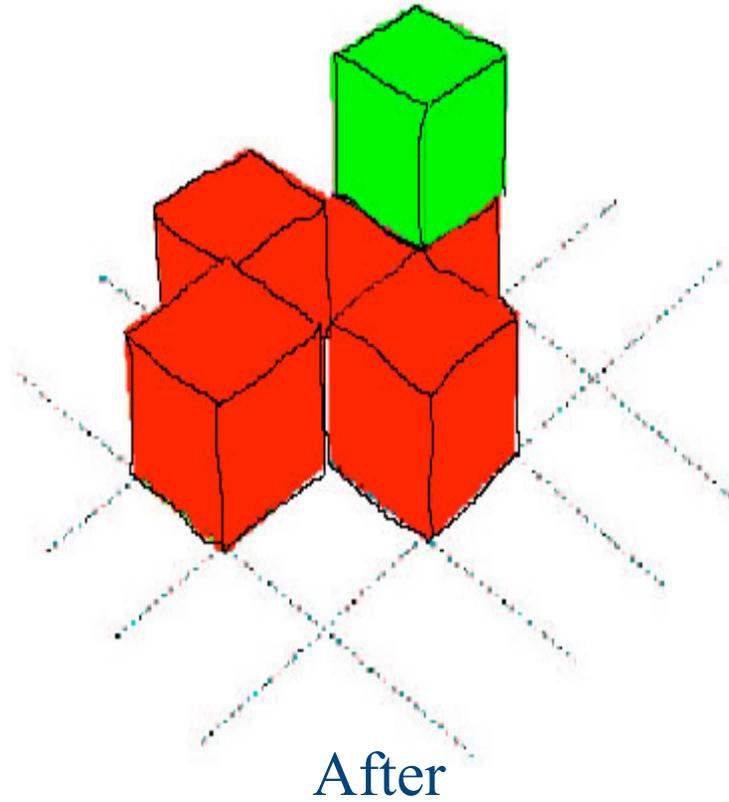

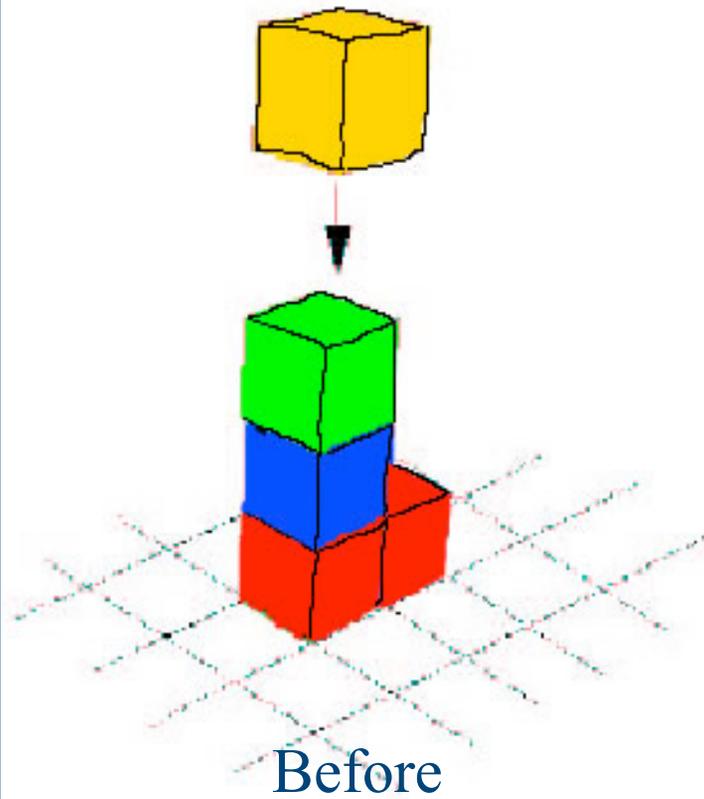

Avalanches

By: Maslov [6]

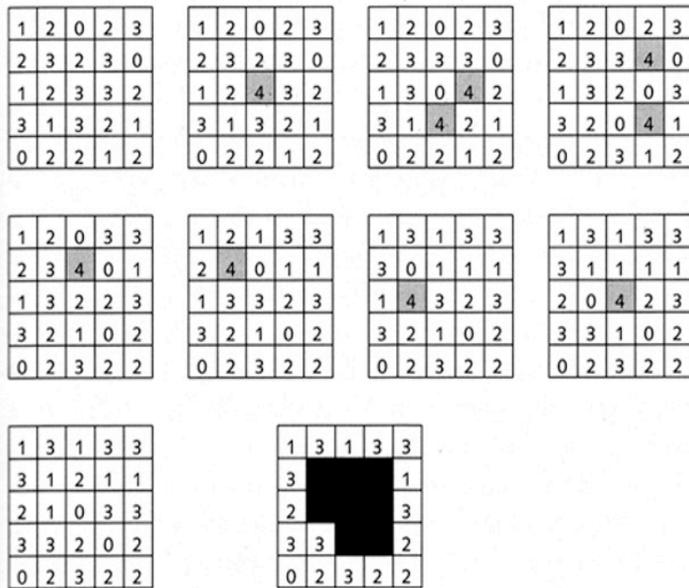

- When threshold has been exceeded, an avalanche occurs
- If $Z(x,y) > 3$
 - $Z(x,y) \rightarrow Z(x,y) - 4$
 - $Z(x+1,y) \rightarrow Z(x+1,y) + 1$
 - $Z(x,y) \rightarrow Z(x,y+1) + 1$

Before and After

Domino Effect

- Avalanches may propagate

By: Bak [1]

DEMO: By Sergei Maslov

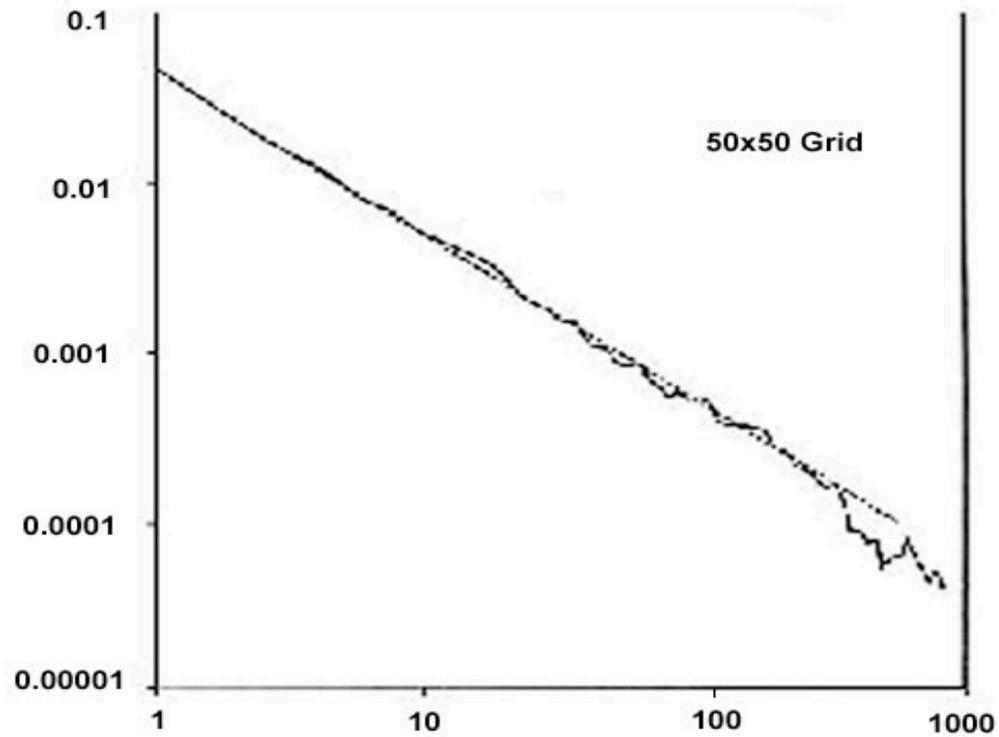

Sandpile Applet

<http://cmth.phy.bnl.gov/~maslov/Sandpile.htm>

Observances

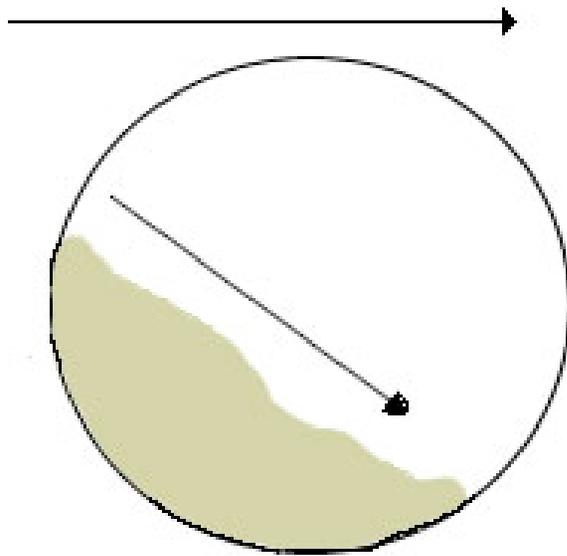

- Transient/stable phase
- Progresses towards Critical phase
 - At which avalanches of all sizes and durations
- Critical state was robust
 - Various initial states. Random, not random
- Measured events follow the desired Power Law

Size Distribution of Avalanches

By: Bak [1]

Sandpile: Model Variations

Rotating Drum

- Rotating Drum
- Done by Heinrich Jaeger
- Sand pile forms along the outside of the drum

Other applications

- Evolution
- Mass Extinction
- Stock Market Prices
- The Brain

Conclusion

- Shortfalls

- Does not explain why or how things self-organize into the critical state
- Cannot mathematically prove that systems follow the power law

- Benefits

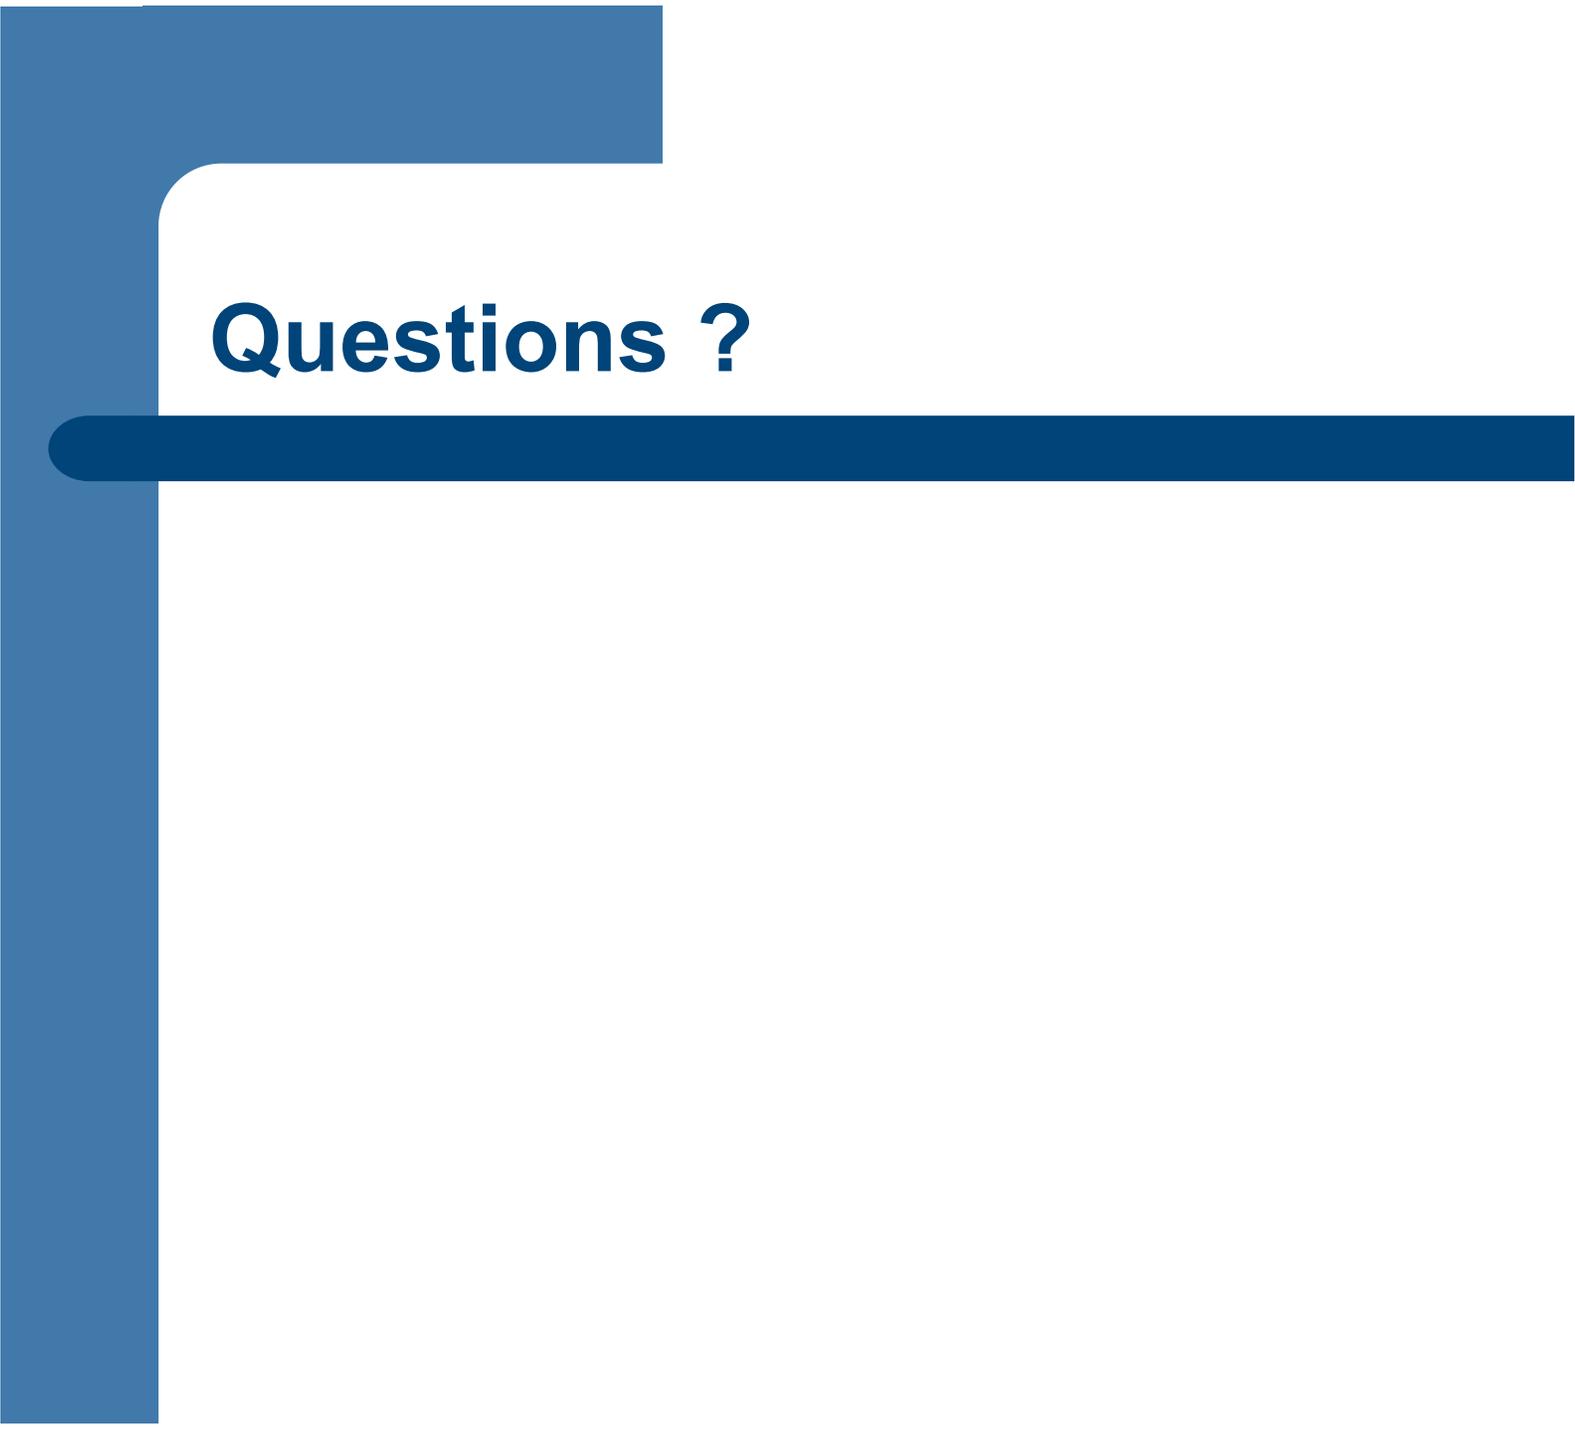

- Gives us a new way of looking at old problems
