

Breaking Problems Down

This section of notes shows you how to break down a large programming problem into smaller modules that are easier to manage.

James Tam

Designing A Program: Top-Down Approach

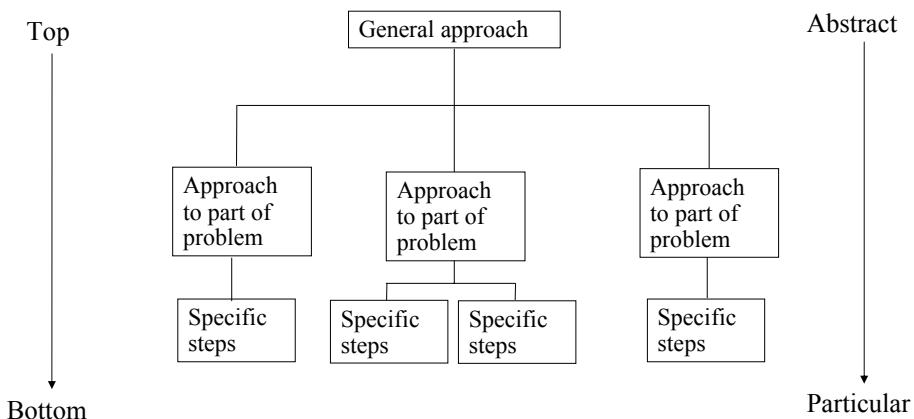

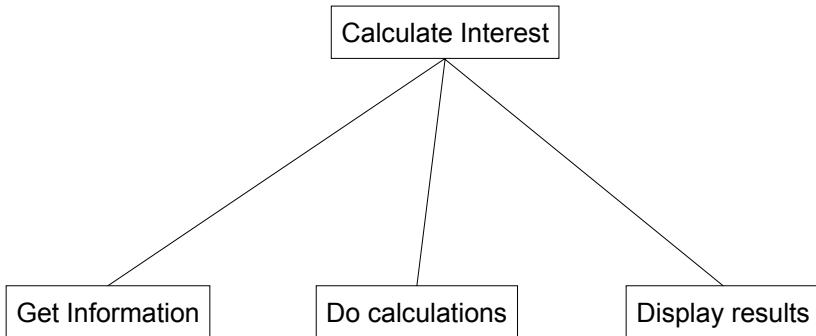

Figure extracted from Computer Science Illuminated by Dale N. and Lewis J.

James Tam

Top Down Approach: Programming

James Tam

Decomposing Problems Via The Top Down Approach

Characteristics

- Breaking problem into smaller, well defined modules
- Making modules as independent as possible (loose coupling)

Benefit

- Solution is easier to visualize
- Easier to maintain (if modules are independent)

Drawback

- Complexity – understanding and setting up inter module communication may appear daunting at first

Pascal implementation of program modules

- Procedures
- Functions

James Tam

Using Functions And Procedures In Pascal

Definition

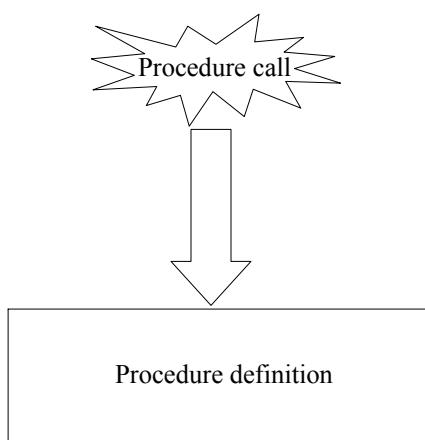

- Indicating what the function or procedure will do

Call

- Executing the code in the function or procedure

James Tam

Procedures (Basic Case – No Parameters)

James Tam

Defining Procedures (Basic Case – No Parameters)

Format:

```
procedure name;  
begin  
    (* Statements of the function go here *)  
end; (* End of procedure name *)
```

Example:

```
procedure displayInstructions;  
begin  
    writeln ('These statements will typically give a high level');  
    writeln('overview of what the program as a whole does');  
end; (* End of procedure displayInstructions *)
```

James Tam

Where To Define Modules (Procedures)

Header

Declarations

const

Procedure and function definitions

:

Statements

begin

end.

James Tam

Defining Local Variables

Exist only for the life the module

Format:

```
procedure name;  
var  
    (* Local variable declarations go here *)  
begin  
    :  
end;
```

Example:

```
procedure proc;  
var  
    num : integer;  
    ch  : char;  
begin  
    :  
end; (* Procedure celciusToFahrenheit *)
```

James Tam

Calling A Procedure (Basic Case – No Parameters)

Format:

name;

Example:

displayInstructions;

James Tam

Where To Call Modules (Procedures)

Most anywhere in the program

Header

```
[REDACTED]

```
begin  
Call module: This example  
end.
```

James Tam

Procedures: Putting Together The Basic Case

A compilable version of this example can be found in Unix under
`/home/231/examples/modules/firstExampleProcedure.p`

```
program firstExampleProcedure (output);  
  
procedure displayInstructions;  
begin  
  writeln ('These statements will typically give a high level');  
  writeln('overview of what the program as a whole does');  
end; (*Procedure displayInstructions *)  
  
begin  
  displayInstructions;  
  writeln('Thank you, come again!');  
end. (* Program *)
```

James Tam

Procedures: Putting Together The Basic Case

A compilable version of this example can be found in Unix under /home/231/examples/modules/firstExampleProcedure.p

```
program firstExampleProcedure (output);
```

```
procedure displayInstructions;
```

```
begin
```

```
    writeln ('These statements will typically give a high level');
```

```
    writeln('overview of what the program as a whole does');
```

```
end; (*Procedure displayInstructions *)
```

```
begin
```

```
    displayInstructions;
```

```
    writeln('Thank you, come again!');
```

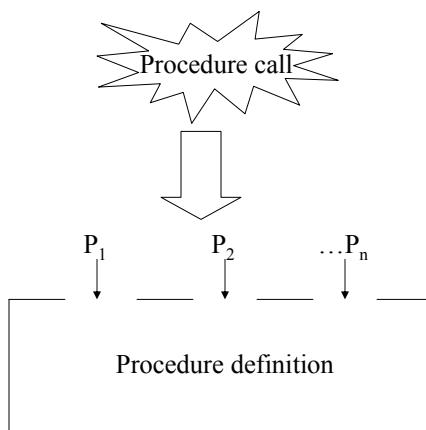

```
end. (* Program *)

James Tam

Procedures With Parameters

James Tam

Defining Modules (Procedures) With Parameters

Format:

```
procedure name (Name of parameter 1 : type of parameter 1;
                  Name of parameter 2 : type of parameter 2;
                  :
                  Name of parameter n : type of parameter n);
begin
    (* Statements of the procedure go here *)
end;
```

Example:

```
procedure celciusToFahrenheit (celciusValue : real);
var
    fahrenheitValue : real;
begin
    fahrenheitValue := 9 / 5 * celciusValue + 32;
    writeln('temperature in Celsius: ', celciusValue:0.2);
    writeln('temperature in Fahrenheit: ', fahrenheitValue:0.2);
end; (* Procedure celciusToFahrenheit *)
```

James Tam

Calling Modules (Procedures) With Parameters

Format:

```
name (Name of parameter 1, Name of parameter 2...Name of
      parameter n);
```

Example:

```
celciusToFahrenheit (celciusValue);
```

James Tam

Procedures: Putting Together The Case Of Procedures With Parameters

A compilable version of this example can be found in Unix under
/home/231/examples/modules/temperatureConverter.p

```
program temperatureConverter (input, output);

procedure celciusToFahrenheit (celciusValue : real);
var
    fahrenheitValue : real;
begin
    fahrenheitValue := 9 / 5 * celciusValue + 32;
    writeln('Temperature in Celsius: ', celciusValue:0:2);
    writeln('Temperature in Fahrenheit: ', fahrenheitValue:0:2);
end; (* Procedure celciusToFahrenheit *)
```

James Tam

Procedures: Putting Together The Case Of Procedures With Parameters

A compilable version of this example can be found in Unix under
/home/231/examples/modules/temperatureConverter.p

```
program temperatureConverter (input, output);
```

```
procedure celciusToFahrenheit (celciusValue : real);
var
    fahrenheitValue : real;
begin
    fahrenheitValue := 9 / 5 * celciusValue + 32;
    writeln('Temperature in Celsius: ', celciusValue:0:2);
    writeln('Temperature in Fahrenheit: ', fahrenheitValue:0:2);
end; (* Procedure celciusToFahrenheit *)
```

Procedure definition

James Tam

Procedures: Putting Together The Case Of Procedures With Parameters (2)

```
begin
  var celciusValue : real;
  writeln;
  writeln('This program will convert a given temperature from a Celsius');
  writeln('value to a Fahrenheit value.');
  write('Enter a temperature in Celsius: ');
  readln(celciusValue);
  writeln;
  celciusToFahrenheit(celciusValue);
  writeln('Thank you and come again.');
end. (* Program *)
```

James Tam

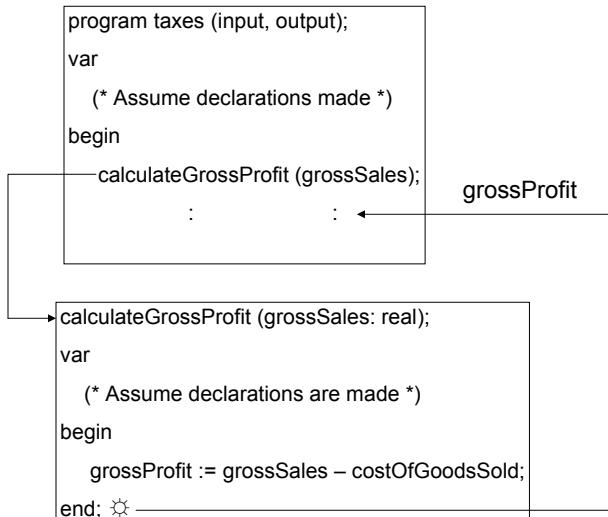

Procedures: Putting Together The Case Of Procedures With Parameters (2)

```
begin
  writeln;
  writeln('This program will convert a given temperature from a Celsius');
  writeln('value to a Fahrenheit value.');
  write('Input temperature in Celsius: ');
  readln(celciusValue);
  writeln;
  celciusToFahrenheit(celciusValue); Procedure call
  writeln('Thank you and come again.');
end. (* Program *)
```

James Tam

Retaining Information From A Module (Function Or Procedure) After The Module Has Ended

e.g., producing an income statement

James Tam

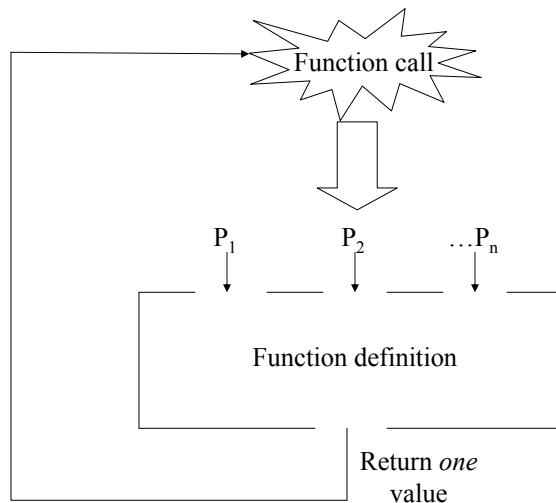

Retaining Information From A Module (Function Or Procedure) After The Module Has Ended (2)

Methods:

- **Return a value with a function**
- Pass parameters into the procedure as variable parameters (rather than as value parameters)

James Tam

Functions

James Tam

Defining Functions

Format:

```
function name (Name of parameter 1 : type of parameter 1;  
                  Name of parameter 2 : type of parameter 2;  
                  ...  
                  Name of parameter n : type of parameter n):  
                  return type;  
begin  
    (* Statements of the function go here *)  
    ...  
    name := expression; (* Return value *)  
end;
```

Example:

```
function calculateGrossIncome (grossSales, costOfGoodsSold : real) : real;  
begin  
    calculateGrossIncome := grossSales - costOfGoodsSold;  
end;
```

James Tam

Defining Functions

Format:

```
function name (Name of parameter 1 : type of parameter 1;  
               Name of parameter 2 : type of parameter 2;  
               :  
               Name of parameter n : type of parameter n);  
               return type;  
begin  
    (* Statements of the function go here *)  
    :  
    :  
    name := expression; (* Return value *)  
end;
```

Often the last statement in the function

Example:

```
function calculateGrossIncome (grossSales, costOfGoodsSold : real) : real;  
begin  
    calculateGrossIncome := grossSales - costOfGoodsSold;  
end;
```

James Tam

Calling Functions

Format:

name;

name (name of parameter 1, name of parameter 2...name of parameter n);

Example:

```
grossIncome := calculateGrossIncome (grossSales, costOfGoodsSold);
```

James Tam

Functions: Putting It All Together

A compilable version of this example can be found in Unix under
/home/231/examples/modules/financialStatements.p

```
program financialStatements (input, output);

function calculateGrossIncome (grossSales, costOfGoodsSold : real) : real;
begin
    calculateGrossIncome := grossSales - costOfGoodsSold
end;

function calculateNetIncome (grossIncome, expenses : real) : real;
begin
    calculateNetIncome := grossIncome - expenses;
end;
```

James Tam

Functions: Putting It All Together

A compilable version of this example can be found in Unix under
/home/231/examples/modules/financialStatements.p

```
program financialStatements (input, output);
```

```
function calculateGrossIncome (grossSales, costOfGoodsSold : real) : real;
begin
    calculateGrossIncome := grossSales - costOfGoodsSold
end;
```

```
function calculateNetIncome (grossIncome, expenses : real) : real;
begin
    calculateNetIncome := grossIncome - expenses;
end;
```

Function definitions

James Tam

Functions: Putting It All Together (2)

```
procedure produceIncomeStatement;
var
    grossSales      : real;
    costOfGoodsSold : real;
    grossIncome     : real;
    expenses        : real;
    netIncome       : real;
begin
    write('Enter gross sales $');
    readln(grossSales);
    write('Enter cost of the goods that were sold $');
    readln(costOfGoodsSold);
    write('Enter corporate expenses $');
    readln(expenses);

    grossIncome := calculateGrossIncome (grossSales, costOfGoodsSold);

    netIncome := calculateNetIncome (grossIncome, expenses);
```

James Tam

Functions: Putting It All Together (2)

```
procedure produceIncomeStatement;
var
    grossSales      : real;
    costOfGoodsSold : real;
    grossIncome     : real;
    expenses        : real;
    netIncome       : real;
begin
    write('Enter gross sales $');
    readln(grossSales);
    write('Enter cost of the goods that were sold $');
    readln(costOfGoodsSold);
    write('Enter corporate expenses $');
    readln(expenses);
```

Function calls

```
grossIncome := calculateGrossIncome (grossSales, costOfGoodsSold);
```

```
netIncome := calculateNetIncome (grossIncome, expenses);
```

James Tam

Functions: Putting It All Together (3)

```
(* Procedure produceIncomeStatement continued *)
writeln;
writeln('Gross sales $:26, grossSales:0:2);
writeln('Less: cost of goods sold $:26, costOfGoodsSold:0:2);
writeln('Gross income $:26, grossIncome:0:2);
writeln('Less: expenses $:26, expenses:0:2);
writeln('Net income $:26, netIncome:0:2);
writeln;
end; (* End of procedure produceIncomeStatement *)
```

James Tam

Functions: Putting It All Together (4)

```
(* Start of main program *)
begin
writeln;
writeln('This program will produce an income statement based upon your');
writeln('gross sales figures, the cost of the goods that you sold and
writeln('your expenses.');
writeln;
produceIncomeStatement;
writeln('Thank you, come again!');
end. (* End of entire program. *)
```

James Tam

Retaining Information From A Module (Function Or Procedure) After The Module Has Ended

Methods:

- Return a value with a function
- **Pass parameters into the procedure as variable parameters (rather than as value parameters)**

James Tam

Passing Parameters As Value Parameters

Previous examples

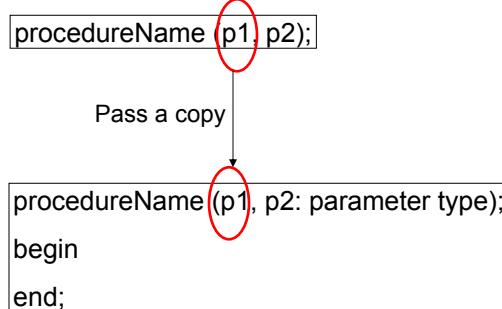

```
procedureName (p1, p2);
```

```
procedureName (p1, p2: parameter type);
begin
end;
```

James Tam

Passing Parameters As Value Parameters

James Tam

Procedure Definitions When Passing Parameters As Variable Parameters

Format:

```
procedure name (var Name of parameter 1 : type of parameter 1;  
                var Name of parameter 2 : type of parameter 2;  
                :  
                :  
                var Name of parameter n : type of parameter n);  
begin  
    (* Statements of the function go here *)  
end;
```

Example:

```
procedure tabulateIncome (    grossSales      : real;  
                            costOfGoodsSold : real;  
                            var grossIncome   : real;  
                            expenses        : real;  
                            var netIncome     : real);
```

```
begin  
    grossIncome := grossSales - costOfGoodsSold;  
    netIncome := grossIncome - expenses;  
end;
```

James Tam

Calling Procedures With Variable Parameters

Same as calling procedures with value parameters!

Format:

name (name of parameter 1, name of parameter 2...name of parameter n);

Example:

```
tabulateIncome(grossSales,costOfGoodsSold,grossIncome,expenses,  
netIncome);
```

James Tam

Passing Variable Parameters: Putting It All Together

A compilable version of this example can be found in Unix under
`/home/231/examples/modules/financialStatements2.p`

```
program financialStatements (input, output);

procedure getIncomeInformation (var grossSales      : real;
                                var costOfGoodsSold : real;
                                var expenses        : real);
begin
  write('Enter gross sales $');
  readln(grossSales);
  write('Enter the cost of the goods that were sold $');
  readln(costOfGoodsSold);
  write('Enter business expenses $');
  readln(expenses);
end; (* End of procedure getIncomeInformation *)
```

James Tam

Passing Variable Parameters: Putting It All Together (2)

```
procedure tabulateIncome (    grossSales      : real;
                             costOfGoodsSold : real;
                             var grossIncome   : real;
                             expenses        : real;
                             var netIncome     : real);
begin
  grossIncome := grossSales - costOfGoodsSold;
  netIncome := grossIncome - expenses;
end; (* End of procedure tabulateIncome *)
```

James Tam

Passing Variable Parameters: Putting It All Together (3)

```
procedure displayIncomeStatement (grossSales      : real;
                                 costOfGoodsSold : real;
                                 grossIncome    : real;
                                 expenses       : real;
                                 netIncome      : real);
begin
  writeln;
  writeln('INCOME STATEMENT':40);
  writeln('Gross sales $':40, grossSales:0:2);
  writeln('Less: Cost of the goods that were sold $':40, costOfGoodsSold:0:2);
  writeln('Equals: Gross Income $':40, grossIncome:0:2);
  writeln('Less: Business Operating Expenses $':40, expenses:0:2);
  writeln('Equals: Net income $':40, netIncome:0:2);
  writeln;
end; (* End of displayIncomeStatement *)
```

James Tam

Passing Variable Parameters: Putting It All Together (4)

```
procedure produceIncomeStatement;  
var  
    grossSales, grossIncome, costOfGoodsSold, expenses, netIncome :real;  
begin  
    getIncomeInformation(grossSales, costOfGoodsSold, expenses);  
    tabulateIncome(grossSales,costOfGoodsSold,grossIncome,expenses,netIncome);  
    displayIncomeStatement  
        (grossSales,costOfGoodsSold,grossIncome,expenses,netIncome);  
end; (* End of procedure produceIncomeStatement *)
```

James Tam

Passing Variable Parameters: Putting It All Together (5)

```
(* Begin main program *)  
begin  
    writeln;  
    writeln('This program will produce an income statement based upon your');  
    writeln('gross sales figures, the cost of the goods that you sold and');  
    writeln('your expenses.');    writeln;  
    produceIncomeStatement;  
    writeln('Thank you, come again!');  
end. (* End of main program *)
```

James Tam

Scope

It determines when a part of a program (Constant, variable, function, procedure) is available for use in that program.

e.g., variables or constants must first be declared before they can be referred to or used.

```
begin
    var num: integer;
    num := 10;
    :
end.
```

James Tam

Scope

It determines when a part of a program (Constant, variable, function, procedure) is available for use in that program.

e.g., variables or constants must first be declared before they can be referred to or used.

```
begin
    var num: integer;           Declaration
    num := 10;                 Usage
    :
end.
```

James Tam

Scope

It determines when a part of a program (Constant, variable, function, procedure) is available for use in that program.

e.g., variables or constants must first be declared before they can be referred to or used.

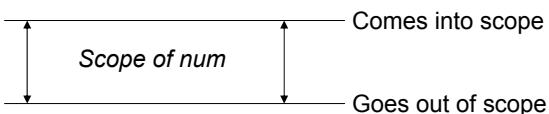

```
begin
```

```
  var num: integer;
```

```
  num := 10;
```

```
  :      :
```

```
end.
```

James Tam

Scope (2)

A complete version of this program can be found in Unix under:
/home/231/examples/modules/scope1.p

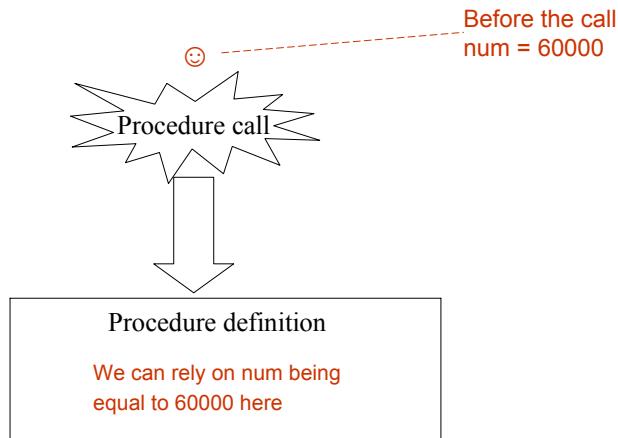

```
program scope1 (output);
const
  SIZE = 10;
var
  num : integer;
  ch : char;
procedure proc1;
var
  x, y : real;
begin
  writeln('In proc1');
end;
begin
  end.
```

James Tam

Preconditions

Describe what should be true before a statement is executed

e.g., What will be the value of a variable before a procedure call.

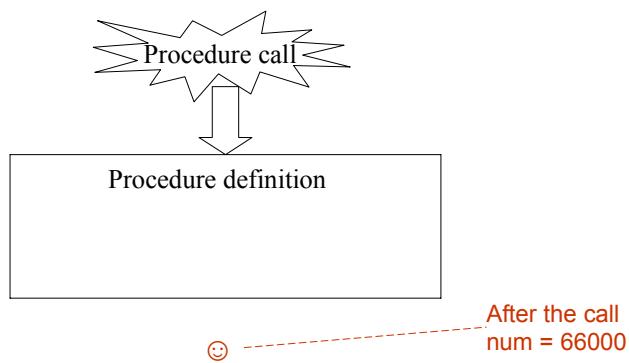

James Tam

Postconditions

Describe what should be true after a statement is executed

e.g., What will be the value of a variable after a procedure call.

James Tam

Preconditions And PostConditions

Relative: One procedure's postcondition can be another procedure's precondition

e.g.,

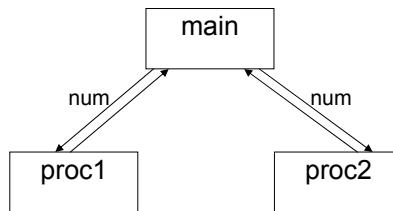

begin

var num: integer;

proc1(num);

proc2(num);

end.

James Tam

Preconditions And PostConditions

Assertions: Both make assumptions about what is the state of (a part of) the program at a certain point.

procedure proc1 (num2: integer);
begin
writeln('At start of proc1: num2=' , num2);
writeln('At end of proc1: num2=' , num2);
end;

procedure proc2 (var num2: integer);
begin
writeln('At start of proc2: num2=' , num2);
num2 := 20;
writeln('At end of proc2: num2=' , num2);
end;

Before the call
num2 = 2

James Tam

Preconditions And Postconditions: An Example

A complete version of this program can be found in Unix under:
/home/231/examples/modules/conditions.p

```
program conditions (output);
var
    num1 : integer;

procedure proc1 (num2: integer);
begin
    writeln('At start of proc1: num2=''', num2);
    writeln('At end of proc1: num2=''', num2);
end; (* Proc 1 *)

procedure proc2 (var num2: integer);
begin
    writeln('At start of proc2: num2=''', num2);
    num2 := 20;
    writeln('At end of proc2: num2=''', num2);
end; (* Proc 2 *)
```

James Tam

Preconditions And Postconditions: An Example (2)

```
procedure proc3;
begin
    writeln('At start of proc3: num1=''', num1);
    num1 := 10;
    writeln('At end of proc3: num1=''', num1);
end; (* Proc 3 *)

begin
    var num2 : integer;
    num1 := 1;
    num2 := 2;
    proc1(num2);
    writeln;
    proc2(num2);
    writeln;
    proc3;
    writeln;
end. (* Main Program * )
```

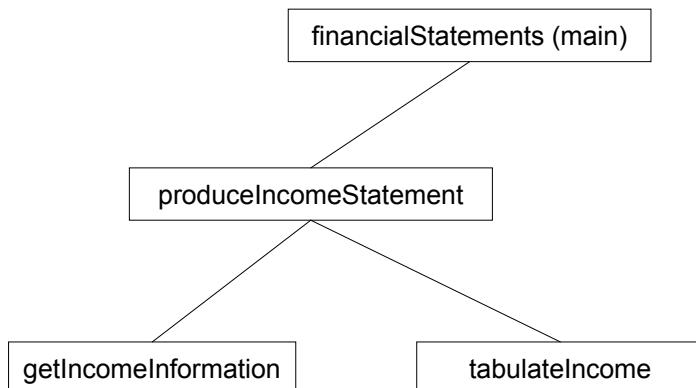

James Tam

Testing Modules

- Making sure the function or procedure does what it is supposed to do e.g., checking if calculations are correct.
- Ties into the top-down approach to design
 - 1) Outline the structure of the program (empty modules)
 - 2) As modules are implemented test each one as appropriate
 - 3) Fix any bugs and add the working module to the program.

James Tam

Outline Of The Financial Program

James Tam

Code Skeleton For The Financial Program

```
procedure tabulateIncome (    grossSales      : real;
                             costOfGoodsSold : real;
                             var grossIncome   : real;
                             expenses        : real;
                             var netIncome     : real);
begin
end;

procedure produceIncomeStatement;
var
  grossSales      : real;
  grossIncome     : real;
  costOfGoodsSold : real;
  expenses        : real;
  netIncome       : real;
begin
  tabulateIncome(grossSales, costOfGoodsSold, grossIncome, expenses,
                 netIncome);
end;
```

James Tam

Code Skeleton For The Financial Program (2)

```
begin
  produceIncomeStatement;
end. (* Main program *)
```

James Tam

Implementation Of Procedure “tabulateIncome”

```
procedure tabulateIncome (    grossSales      : real;
                             costOfGoodsSold : real;
                             var grossIncome   : real;
                             expenses        : real;
                             var netIncome     : real);
begin
  grossIncome := grossSales - costOfGoodsSold;
  netIncome := grossIncome - expenses;
end;
```

James Tam

Testing Procedure “tabulateIncome”

```
procedure produceIncomeStatement;
var
  grossSales      : real;
  grossIncome     : real;
  costOfGoodsSold : real;
  expenses        : real;
  netIncome       : real;
begin
  tabulateIncome(0,0,grossIncome,0,netIncome);
  writeln('Testing "produceIncomeStatement" with all values equal to zero');
  if (grossIncome = 0) AND (netIncome = 0) then
    writeln('Test condition okay')
  else
    begin
      if NOT (grossIncome = 0) then
        writeln('Problem with calculating gross income');
      if NOT (netIncome = 0) then
        writeln('Problem with calculating net income');
    end;
  writeln;
```

James Tam

Testing Procedure “tabulateIncome” (2)

```
tabulateIncome(100, 75, grossIncome,10, netIncome);
writeln('Testing "produceIncomeStatement" with non-zero values');
if (grossIncome = 25) AND (netIncome = 15) then
    writeln('Test condition okay')
else
begin
    if NOT (grossIncome = 25) then
        writeln('Problem with calculating gross income');
    if NOT (netIncome = 15) then
        writeln('Problem with calculating net income');
end;
writeln;
end; (* Procedure tabulateIncome *)
```

James Tam

You Should Now Know

How to break a programming problem down into modules

What is the difference between a procedure and a function

What is the difference between a value parameter and
variable parameter

How to define and call program modules (procedures and
functions)

Variables and scope

- What is a local variable
- What is a global variable
- What is the scope of a procedure or function

What are preconditions and postconditions

How to test functions and procedures

James Tam
