Loops In Pascal

In this section of notes you will learn how to rerun parts of your program without having to duplicate your code.

James Tan

The Need For Repetition (Loops)

Writing out a simple counting program (1-3).

```
program counting (output);
begin
  writeln('1');
  writeln('2');
  writeln('3');
end.
```

The Need For Repetition (2)

Simple program but what if changes need to be made?

• The source code must be re-edited and re-compiled each time that a change is needed.

What if you need the program to count many times?

James Tan

Basic Structure Of Loops

- 1) Initialize the control
 - a) Control typically a variable that determines whether or not the loop executes or not.
- 2) Testing the control against a condition
- 3) Executing the body of the loop
- 4) Update the value of the control

Types Of Loops

Pre-test loops

- 1. Initialize control
- 2. Check if a condition is met (using the control in some Boolean expression)
 - a) If the condition has been met then continue on with the loop (go to step 3)
 - b) If the condition is not met then break out of the loop (loop ends)
- 3. Execute the body of the loop
- 4. Update the value of the control
- 5. Repeat step 2

General characteristics

- The body of the loop executes zero or more times
- Execute body only if the condition is true (stop executing when it becomes false)
- Examples: while-do, for

James Tan

Types Of Loops (2)

Post-test loops

- 1. Initialize control (often this step is unneeded)
- 2. Execute the body of the loop
- 3. Update the value of the control
- 4. Check if a condition is met (using the control in some Boolean expression)
 - a) If the condition has been met then break out of loop (loop ends)
 - b) If the condition hasn't been met then continue on with loop (go to step 2)

General characteristics

- The body of the loop executes one or more times
- Execute body only if condition is false (stop executing when it's true)
- Examples: repeat-until

James Tar

Pre-Test Loop: While-Do

Can be used if the number of times that the loop must execute is not known in advance.

Format:

```
while (Boolean expression) do body
```

Example (The full program can be found in Unix under /home/231/examples/repetition/whileDo.p)

```
i: = 1;
while (i <= 5) do
begin
    writeln('i = ', i);
    i := i + 1;
end; (* while *)</pre>
```

James Tan

Pre-Test Loop: While-Do

Can be used if the number of times that the loop executes is not known in advance.

Format:

```
while (Boolean expression) do body
```

Example (The full program can be found in Unix under /home/231/examples/repetition/whileDo.p)

James Tar

Tracing The While Loop

Variables Execution i ./a.out

James Tam

Pre-Test Loop: For

Typically used when it is known in advance how many times that the loop will execute (counting loops).

Format (counting up):

for *initialize control* to *final value* do body

Format (counting down):

for *initialize control* downto *final value* do body

First For Loop Example

Example one (The full program can be found in Unix under /home/231/examples/repetition/forLoopUp.p)

```
begin
  var i : integer;
  var total : integer;
  total := 0;
  for i := 1 to 5 do
  begin
    total := total + i;
    writeln('i=', i, 'total=', total);
  end; (* for *)
end.
```

Iomas Ton

First For Loop Example

Example one (The full program can be found in Unix under /home/231/examples/repetition/forLoopUp.p)

```
begin

var i : integer;

var total : integer;

total := 0;

for i := 1 to 5 do

begin

total := total + i;

writeln('i=', i, ' total=', total);

end; (* for *)

end.
```

Tracing The First For Loop Example

Variables Execution i total ./a.out

James Tan

Second For Loop Example

Example one (The full program can be found in Unix under /home/231/examples/repetition/forLoopDown.p)

```
begin
  var i : integer;
  var total : integer;
  total := 0;
  for i := 5 downto 1 do
  begin
    total := total + i;
    writeln('i=', i, ' total=',total);
  end; (* for *)
end.
```

Tracing The Second For Loop Example

Variables Execution i total ./a.out

James Tam

Post Test Loops: Repeat-Until

Used instead of a while-do loop if you need the loop to execute the loop at least once.

Format:

repeat

body

until (Boolean expression);

Repeat-Until: An Example

The full version can be found in Unix under: /home/231/examples/repetition/guzzlingGame.p

James Tan

Repeat-Until: An Example (2)

```
repeat
  answer := random(10);
  write('Enter your guess: ');
  readln(guess);
  if (guess = answer) then
     writeln('You guessed correctly!')
  else
     writeln('You guessed incorrectly');
  writeln('Number was ', answer, ', your guess was ', guess);
  write('Play again? Enter "N" or "n" to quit or anything else to ');
  writeln('continue');
  write('Choice: ');
  readln(choice);
  writeln;
until (choice = 'N') OR (choice = 'n');
```

Repeat-Until: An Example (2)

```
repeat
   answer := Random(10);
   write('Enter your guess: ');
   readln(guess);
   if (guess = answer) then
     writeln('You guessed correctly!')
   else
     writeln('You guessed incorrectly');
                                                                           1) Execute body
   writeln('Number was ', answer, ', your guess was ', guess);
   write('Play again? Enter "N" or "n" to quit or anything else to ');
   writeln('continue');
   write('Choice: ');
   readln(choice);
   writeln;
                                                             3) Test condition
until (choice = 'N') OR (choice = 'n');
```

Infinite Loops

Infinite loops never end (the stopping condition is never met).

They can be caused by logical errors:

- The loop control is never updated (Example 1 below).
- The updating of the loop control never brings it closer to the stopping condition (Example 2 next slide).

Example 1 (The full version can be found in Unix under /home/231/examples/repetition/infinite1.p)

```
i := 1;
while (i <=10) do
    writeln('i=', i);
i := i + 1;</pre>
```

To stop a program with an infinite loop in Unix simultaneously press the <ctrl> and the <c> keys

Infinite Loops (2)

Example 2 (The full version can be found in Unix under /home/231/examples/repetition/infinite2.p)

```
    i := 10;
    while (i > 0) do
    begin
    writeln('i = ', i);
    i := i + 1;
    end;
```

To stop a program with an infinite loop in Unix simultaneously press the <ctrl> and the <c> keys

James Tan

Nested Loops

One loop executes inside of another loop(s).

Example structure:

```
Outer loop (runs n times)

Inner loop (runs m times)

Body of inner loop (runs n x m times)
```

Example program (the full program can be found in Unix under: /home/231/examples/repetition/nested.p)

```
for i := 1 to 2 do
  for j := 1 to 3 do
    writeln('i=', i, ' j=', j);
writeln('All done!');
```

Testing Loops

Make sure that the loop executes the proper number of times.

Test conditions:

- 1) Loop does not run
- 2) Loop runs exactly once
- 3) Loop runs exactly "n" times

James Tan

Testing Loops: An Example

```
program testLoops (input, output);
begin
  var sum : integer;
  var i : integer;
  var last : integer;
  sum := 0;
  i := 1;
  write('Enter the last number in the sequence to sum : ');
  readln(last);
```

James Tan

Testing Loops: An Example (2)

```
while (i <= last) do

begin

sum := sum + i;

writeln('i=', i);

i := i + 1;

end;

writeln('sum=', sum);
end.</pre>
```

Iomos Ton

You Should Now Know

When and why are loops used in computer programs

What is the difference between pre-test loops and post-test loops

How to trace the execution of pre and post-test loops

How to write the code for a loop in a program

What are nested loops and how do you trace their execution

How to test the execution of loop
