

# Task-Centered System Design

**How to develop task examples**

**How to evaluate designs through a task-centered walk-through**

**Exercise: The Cheap Shop interface**

**The goal-centered approach**

James Tam

James Tam

## Requirements Analysis: Focusing On The Software

- **Designing for a faceless user:** A pretend person that will magically change his or her abilities to adapt to your system (elastic user)

James Tam

## Requirements Analysis: Focusing On The Person

- **Determining *who* will be doing exactly *what* with your system**
- **Designing for Mary Hart:** A real person with real constraints that is trying to get her job done (inelastic user)

James Tam

## The Task-Centered Process

### **Phase I: Identification**

- Identify specific users (*who*)
- Articulate realistic example tasks (*what*)

### **Phase II: Requirements**

- Decide which of these *tasks* and which *user group* that the design will support in order to determine the requirements of the system

### **Phase III: Design**

- Base design representations and dialog sequences on the tasks

### **Phase IV: Walkthrough Evaluations**

- Using your design, walk through your scenarios in order to test the proposed interface

James Tam

## Prior To Starting The Task-Centered Process (For Assignment 1)

### **Do a write up for “Phase 0”.**

- It is not part the traditional Task-Centered approach but is needed for your TA:
- Background environment

- What the system will be used for

- System constraints

James Tam

## Phase I: Identification

### **1. Get in touch with real people who will be potential users of your system**

- Identify a range of actual end users

Prototypical examples

Example users: Accountants

Extreme examples

James Tam

## Phase I: Identification

### **Spend time with them discussing how the system might fit in**

- Determine who would be willing to talk to you about this?
- If you can't get them interested, who will actually buy/use your system?

### **Learn about the user's tasks**

- Articulate concrete, detailed examples of tasks they currently complete or those that they want to complete (ones that they currently can't do but want to do with your system)
- Categorize the tasks
  - Routine
  - Infrequent but important
  - Infrequent and unimportant

James Tam

## Phase I: Identification

### Identify a broad coverage of users and task types

- The typical 'expected' users

Accountant

- Typical and routine tasks
- Infrequent but important tasks
- Infrequent and unimportant tasks

- The occasional but important users

Manager

- Typical and routine tasks
- Infrequent but important tasks
- Infrequent and unimportant tasks

- The unusual users

Support staff

- Typical and routine tasks
- Infrequent but important tasks
- Infrequent and unimportant tasks

James Tam

## Phase I: Identification

### Ways of getting information about users and their tasks

- Direct contact (ideal)

- Interview an intermediary (reasonable alternative)

OR

### If all else fails..

- Describe your expected set of users and expected set of tasks
- These will become your 'assumed users and tasks'
- **Be sure** that you verify this information and modify your assumptions accordingly

James Tam

## Phase I: Identification

### **2. Use the information about the users and their tasks to produce several task examples**

*Task Examples: Are stories that describe the actual usage of the system as well as providing a detailed description of the person who is using that system.*

Image from USA Today

James Tam

## Phase I: Identification

### **Characteristics of good a task**

- a) Says what the user wants to do but not how they would do it
    - No assumptions made about the interface
    - Can be used to compare different design alternatives in a fair way
  - b) Are very specific
    - Says exactly what the user wants to do
    - Specifies actual items the user would eventually want to input (in some form)
  - c) Describes a complete job
    - Forces designer to consider how interface features work together
    - Contrasts how information input/output flows through the dialog
- Do not:*
- *Just create a simple list of things that the system should do*
  - *Present a goal independent of other goals*

James Tam

## Phase I: Identification

- d) Says who the users are
- Describe what they know
  - Name names, if possible
  - Reflects the real interests of real users
  - Find tasks that illustrate functionality in a person's real work context

James Tam

## Phase I: Identification

### 3. Tasks are evaluated

- Circulate descriptions to users, and rewrite if needed.
- Ask users for:
  - omissions,
  - corrections,
  - clarifications,
  - suggestions.

James Tam

## Phase II: Requirements

### **Which user groups will be addressed by the interface?**

- Designs can rarely handle everyone!

Coffee Cup Software

Dilbert © United Features Syndicate

James Tam

## Phase II: Requirements

### **Which user groups will be addressed by the interface?**

- Designs can rarely handle everyone!

- Typical and routine tasks
- Infrequent but important tasks
- Infrequent and unimportant tasks

- Typical and routine tasks
- Infrequent but important tasks
- Infrequent and unimportant tasks

- Typical and routine tasks
- Infrequent but important tasks
- Infrequent and unimportant tasks

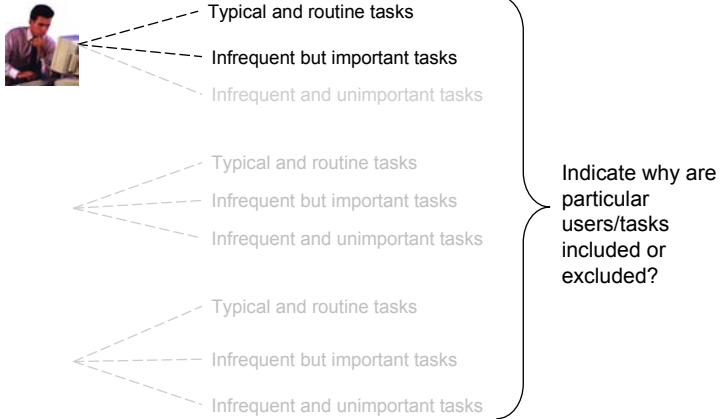

James Tam

## Phase II: Requirements

### **Which user groups will be addressed by the interface?**

- Designs can rarely handle everyone!

James Tam

## Phase II: Requirements

### **Which tasks will be addressed by the interface?**

- Requirements listed in terms of how they address tasks
  - Absolutely must include:
    - ...
  - Should include:
  - Could include:
    - ...
  - Exclude:
    - ...
- Discussion includes why each requirement belongs in a particular category

James Tam

## Phase III: Design As Scenarios

1. **Develop prototype interfaces around the user group and their tasks**
2. **Convert the tasks to scenarios**

James Tam

## Phase III: Design As Scenarios (Tasks Vs Scenarios)

### **Tasks**

- Design independent
  - Allows different ideas to be tried out (written up in Phase I)
- “Millie Varunda is price-comparing the costs of a child’s bedroom set, consisting of a wooden desk, a chair, a single bed, a mattress, a bedspread, and a pillow all made by Furnons Inc. She takes the description and total cost away with her to check against other stores.”*

### **Scenarios**

- Design specific
- Used to evaluate the effectiveness of a particular design (converted from the tasks in Phase III).
- *“..Bob takes Millie’s list and walks over to the computer. He selects the first screen and selects the number field under the catalog item heading. Bob then types in 323000111 into the input field and adjusts the spinner control to increase the number of items from default of 1 to the desired value of 3...”*

James Tam

## Phase IV: Walk-Through Evaluation

### Scenarios are good for debugging an interface

- Usability debugging

### Algorithm for a walk-through evaluation:

#### 1. Select one of the scenarios

#### 2. For each user's step/action in the scenario:

- a) Can you build a believable story that **motivates** the user's actions?
- b) Can you rely on the user's expected **knowledge and training** about system?
- c) If you cannot rely on the above then you've located a problem!
  - Once a problem is identified, either jot down a quick solution or assume that it has been repaired and go to the next step in the scenario

James Tam

## Example: The Cheap Shop Catalog Store

- In Cheap Shop, people shop by browsing the paper catalogs scattered around the store.

- When people see an item they want, they enter the item code and price from the catalog onto a form.

Item code	Amount
323066 697	1

James Tam

## Example: The Cheap Shop Catalog Store

- People give this form to a clerk, who brings the item(s) from the back room to the front counter.

James Tam

## Example: The Cheap Shop Catalog Store

- People then pay for the items they want.

James Tam

James Tam

## Specifications

- **To create an order**
  - On screen 1, shoppers enter their personal information and their first order
  - Text is entered via keyboard
  - The tab or mouse is used to go between fields.
- **Further orders**
  - Shoppers go to the 2nd screen by pressing the 'Next Catalog Item' button
- **Order completion**
  - Shoppers select 'Trigger Invoice'.
  - The system automatically tells shipping and billing about the order
  - The system returns to a blank screen #1
- **To cancel order**
  - Shoppers do not enter input for 30 seconds (as if they walk away)
  - The system will then clear all screens and return to the main screen
- **Input checking**
  - All input fields are checked when either button is pressed.
  - Erroneous fields will blink for 3 seconds, and will then be cleared.
  - The shopper can then re-enter the correct values in those fields.

James Tam

## Developing Task Examples: Cheap Shop

### Task example 1

- Fred Johnson, who is caring for his demanding toddler son, wants a good quality umbrella stroller (red is preferred, but blue is acceptable).
- He browses the catalog and chooses the “Roll ‘em out” brand stroller (cost \$99.95 item code 323 066 697).
- He pays for it in cash, and uses it immediately.
- Fred is a first-time customer to this store, has little computer experience, and says he types very slowly with one finger. He lives nearby at #1109 Dalhousie Dr. N.W.

**Roll ‘em out stroller.** This well made but affordable Canadian stroller fits children between 1-3 years old. Its wheels roll well in light snow and mud.

...\$99.95

Red: **323 066 697**  
Blue: **323 066 698**

James Tam

## Developing Task Examples: Cheap Shop

### Discussion

- Fred has many properties of our typical expected user:
  - Many customers are first time shoppers,
  - A good number have no computer experience
  - A good number are poor typists.
- The task type is routine and important.
  - Many people often purchase only one item
  - A good number of those pay by cash
  - As with Fred, people often have a general sense of what they want to buy, but decide on the actual product only after seeing what is available.

James Tam

## Developing Task Examples: Cheap Shop

### **Task example 2**

- Millie Varunda is price-comparing the costs of a child's bedroom set:
  - a wooden desk, a chair, a single bed, a mattress, a bedspread, and a pillow all made by Furnons Inc.
- She takes the description and total cost away with her to check against other stores.
- Three hours later, she returns and decides to buy everything but the chair.
- She pays by credit card.
- She asks for the items to be delivered to her daughter's home at 47 Sun Valley Drive S.W., in the basement suite at the back of the house.
- Millie is elderly and arthritic.

James Tam

## Developing Task Examples: Cheap Shop

### **Discussion**

- Like Millie,
  - A reasonable number of store customers are elderly, with infirmities that inhibit their physical abilities.
  - A modest number of them also enjoy comparison shopping, perhaps because they have more time on their hands or because they are on a fixed income.
- The task type is less frequent, but still important.
  - Although this would be considered a 'major' purchase in terms of the total cost, the number of items purchased is not unusual.
  - Delivery of large items is the norm.
  - Most customers pay by credit card for larger orders.

James Tam

## Developing Task Examples: Cheap Shop

### Task example 3

- Jim Tam, Ace Salesguy™, is the sole salesperson in the store and has been given a list of 10 items by a customer who does not want to use the computer.
- The items are:
  - 4 pine chairs, 1 pine table, 6 blue place mats, 6 “Lor” forks, 6 “Lor” table spoons, 6 “Lor” teaspoons, 6 “Lor” knives, 1 “Tot” tricycle, 1 red ball, 1 “Silva” croquet set
- After seeing the total, the customer tells Jim he will take all but the silverware.
- The customer then decides to add 1 blue ball to the list.
- The customer starts paying by credit card, but then decides to pay cash and tells Jim he wants the items delivered to his home the day after tomorrow. While this is occurring, 6 other customers are waiting in line.
- Jim is a new employee and this is the first time that he has worked the front counter alone

James Tam

## Developing Task Examples: Cheap Shop

### Discussion

- This task introduces the clerk as a system user.
  - Because the store has a high turnover in its staff, new employees such as Jim are also common.
  - Thus Jim reflects a ‘rare’ but important group of users.
- The task type is less frequent, but still important
  - The task, while complex, is fairly typical i.e., people making large numbers of purchases often ask the clerk to help them.
  - Similarly, clerks mention that customers often change their mind partway through a transaction i.e., by changing what they want to buy and/or by changing how they want to pay for it.
  - Customers, however, rarely give specific delivery dates, with most wanting delivery as soon as possible.
  - Lineups for clerks are common during busy times.

James Tam

## Walkthrough Template For Each Scenario

Scenario number: \_\_\_\_

No.	Description of step	Does the user have the knowledge/training to do this?	Is it believable that they are they motivated to this?	Comment / solution

James Tam

## Contrasting Goals Vs. Tasks

### **Goal**

- Desired end condition
- Tend to be stable over time

### **Task**

- The intermediary process that you go through to achieve your goal.
- May change as technology and work patterns change over time.

James Tam

## Goal-Centered System Design

### **Develop a Persona**

- A precise and specific description of the user and what the person wishes to accomplish (goals)
- A pretend user developed from investigating the problem domain

### **An alternative to the Task-centered approach**

*See Allan Cooper 'The inmates are running the asylum'*

James Tam

## Goal-Centered System Design

### **Develop a cast of characters**

- A set 3 – 12 personas (1 will be the primary persona)

**Avoid elastic personas (be as specific and detailed as possible!)**

James Tam

## **Task-Based Vs. Goal-Based Approach**

### **Task-based**

- Design is based on real users
- Provides a clear starting point
- Can ask actual users for more information

### **Goal-based**

- Design is based on imaginary personas
- Avoids outlier cases

### **Both**

- Provide a focus for the design (resolve design conflicts)

James Tam

## **You Now Know**

**How to develop concrete task examples**

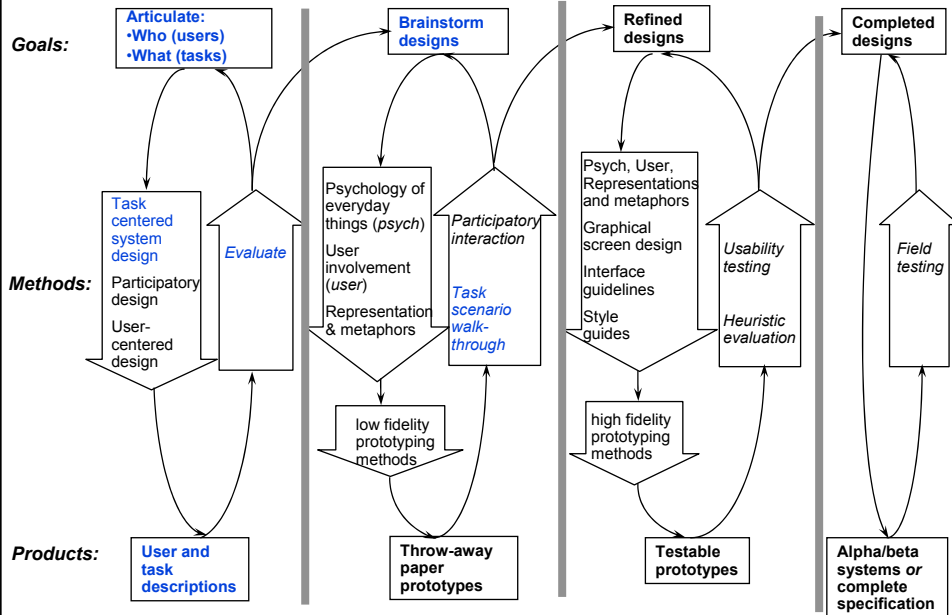

**How to use task examples to motivate your designs**

**How to evaluate designs through task-centered walkthroughs**

**What is the goal-centered approach to system design and how it differs from the task-centered approach**
