

Recursion

You will learn the definition of recursion as well as seeing how simple recursive programs work

James Tam

What Is Recursion?

“the determination of a succession of elements by operation on one or more preceding elements according to a rule or formula involving a finite number of steps” (Merriam-Webster online)

James Tam

What This Really Means

Breaking a problem down into a series of steps. The final step is reached when some basic condition is satisfied. The solution for each step is used to solve the previous step. The solution for all the steps together form the solution to the whole problem.

(The “Tam” translation)

James Tam

Definition For Philosophy

“...state of mind of the wise man; practical wisdom...”¹

*See **Metaphysics***

Metaphysics

*“...know the ultimate grounds of being or what it is that really exists, embracing both psychology and **ontology**.”²*

Result Of Lookup , Possibility One: Success

- I know what Ontology means!

Result Of Lookup, Possibility One

James Tam

Result Of Lookup, Possibility Two: Failure

- Lookups loop back.

James Tam

Result Of Lookup, Possibility Two

Philosophy?

Metaphysics?

Rats!!!

See
previous

Ontology?

James Tam

Ontology

*"...equivalent to metaphysics."*³

James Tam

Result Of Lookup, Possibility Three: Failure

- You've looked up everything and still don't know the definition!

James Tam

Looking Up A Word

if (you completely understand a definition) then
 return to previous definition (using the definition that's understood)
else
 lookup (unknown word(s))

James Tam

Recursion In Programming

“A programming technique whereby a function calls itself either directly or indirectly.”

James Tam

Direct Call

```
def fun ():  
    :  
    fun ()  
    :
```

James Tam

Indirect Call

James Tam

Indirect Call

James Tam

Indirect Call (2)

The name of the online example is: recursion1.py¹

```
def fun1 ():  
    fun2 ()
```

```
def fun2 ():  
    fun1 ()
```

```
fun1 ()
```

¹ This program nominally fulfills the requirements for recursion but it contains an error.

Requirements For Sensible Recursion

- 1) Base case
- 2) Progress is made (towards the base case)

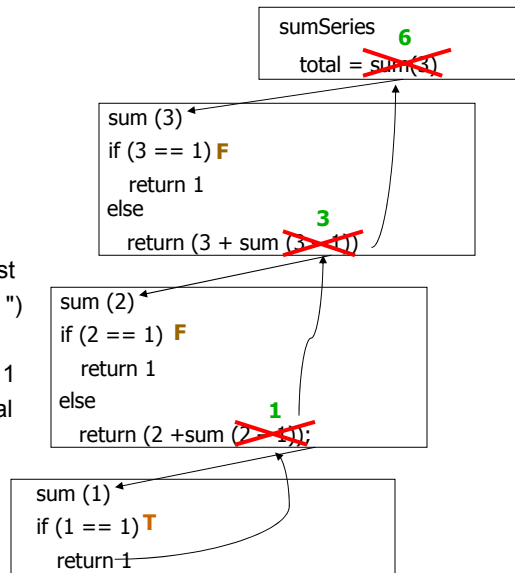

The name of the corresponding online example is: sumSeries.py

Example Program

```
def sum (no):
    if (no == 1):
        return 1
    else:
        return (no + sum(no-1) )

def main ():
    lastNumber = input ("Enter the last
        number in the series: ")
    total = sum (lastNumber)
    print "The sum of the series from 1
        to", lastNumber, "is", total

main ()
```

James Tam

When To Use Recursion

- When a problem can be divided into steps.
- The result of one step can be used in a previous step.
 - There is a scenario when you can stop sub-dividing the problem into steps (recursive calls) and return to previous steps. The solution for a later step solves an early step.
- All of the results together solve the problem.

James Tam

When To Consider Alternatives To Recursion

- When a loop will solve the problem just as well
 - Recursion is used when a loop cannot: There is a scenario when you can stop sub-dividing the problem into steps (recursive calls) and return to previous steps. The solution for a later step solves an early step.
- Types of recursion:
 - Tail recursion
 - A recursive call is the last statement in the recursive function.
 - This form of recursion can easily be replaced with a loop.
 - Non-tail recursion
 - A statement which is not a recursive call to the function comprises the last statement in the recursive module.
 - This form of recursion is very difficult (read: impossible) to replace with a loop.

James Tam

Drawbacks Of Recursion

Function calls can be costly

- Uses up memory
- Uses up time

James Tam

Benefits Of Using Recursion

- Simpler solution that's more elegant (for some problems)
- Easier to visualize solutions (for some people and certain classes of problems – typically require either: non-tail recursion to be implemented or some form of “backtracking”)
- Example: finding the path out of a maze.

Maze

Exit path

James Tam

Common Pitfalls When Using Recursion

- These three pitfalls can result in a runtime error
 - No base case
 - No progress towards the base case
 - Using up too many resources (e.g., variable declarations) for each function call

James Tam

No Base Case

```
def sum (no):  
    return (no + sum (no - 1))
```

James Tam

No Base Case

```
def sum (no):  
    return (no + sum (no - 1))
```

When does it stop???

James Tam

No Progress Towards The Base Case

```
def sum (no):  
    if (no == 1):  
        return 1  
    else:  
        return (no + sum (no))
```

James Tam

No Progress Towards The Base Case

```
def sum (no):  
    if (no == 1):  
        return 1  
    else:  
        return (no + sum (no))
```

The recursive case
doesn't make any
progress towards the
base (stopping) case

James Tam

Using Up Too Many Resources

The name of the online example is: recursion2.py

```
def fun (no):  
    print no  
    aList = []  
    for i in range (0, 10000000, 1):  
        aList.append("")  
    no = no + 1  
    fun (no)
```

James Tam

Undergraduate Definition Of Recursion

Word: re·cur·sion

Pronunciation: ri-'k&r-zh&n

Definition: See recursion

Wav file from "The Simpsons"
