

Making Decisions In Python

In this section of notes you will learn how to have your programs choose between alternative courses of action.

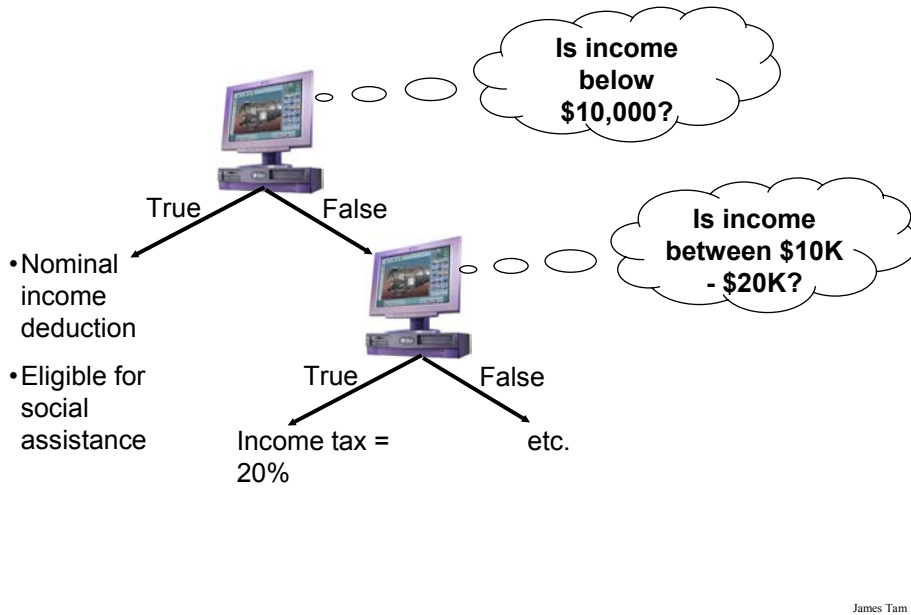

James Tam

Why Is Branching/Decision Making Needed?

- When alternative courses of action are possible and each action may produce a different result.
- Branching/decision making can be used in a program to structure the alternatives and implement the results for each alternative.

James Tam

High Level View Of Decision Making For The Computer

Decision-Making In Python

- Decisions are questions with answers that are either true or false (Boolean) e.g., Is it true that the variable 'num' is positive?
- The program branches one way or another depending upon the answer to the question (the result of the Boolean expression).
- Decision making/branching constructs (mechanisms) in Python:
 - if
 - if-else
 - if-elif-else

Decision Making With An 'If'

James Tam

The 'If' Construct

- Decision making: checking if a condition is true (in which case something should be done).

- **Format:**

(General format)

```
if (Boolean expression):  
    body
```

(Specific structure)

```
if (operand relational operator operand):  
    body
```

Boolean expression

Note: Indenting the body is mandatory!

James Tam

The 'If' Construct (2)

•**Example:**

```
if (age >= 18):  
    print ("You are an adult")
```

James Tam

Allowable Operands For Boolean Expressions

If (operand relational operator operand) then:

Some operands

- integer
- floats (real)
- String

Make sure that you are comparing operands of the same type!

James Tam

Allowable Relational Operators For Boolean Expressions

•If (operand relational operator operand) then

Python operator	Mathematical equivalent	Meaning	Example
<	<	Less than	5 < 3
>	>	Greater than	5 > 3
==	=	Equal to	5 == 3
<=	≤	Less than or equal to	5 <= 5
>=	≥	Greater than or equal to	5 >= 4
<>	≠	Not equal to	5 <> 5
OR			
!=			5 != 5

James Tam

If (Simple Body)

•Body of the if consists of a single statement

•**Format:**

Indenting is used to indicate what statement is the body

if (*Boolean expression*):

s1

Body

s2

Example:

```
if (num == 1):  
    print "Body of the if"  
print "After body"
```

James Tam

If (Compound Body)

- Body of the if consists of multiple statements

- Format:**

if (*Boolean expression*):

James Tam

If (Compound Body(2))

- Program name:** if1.py

- Example:**

```
taxCredit = 0  
taxRate = 0.2  
income = float(input("What is your annual  
income: "))  
if (income < 10000):  
    print ("Eligible for social assistance")  
    taxCredit = 100  
tax = (income * taxRate) - taxCredit  
print ("Tax owed $%.2f" %tax)
```

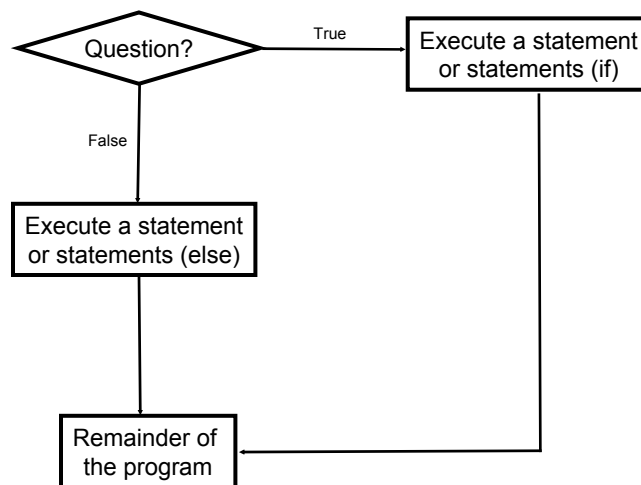

James Tam

Decision Making With An 'If': Summary

- Used when a question (Boolean expression) evaluates only to a true or false value (Boolean):
 - If the question evaluates to true then the program reacts differently. It will execute a body after which it proceeds to the remainder of the program (which follows the if construct).
 - If the question evaluates to false then the program doesn't react different. It just executes the remainder of the program (which follows the if construct).

James Tam

Decision Making With An 'If-Else'

James Tam

The If-Else Construct

- Decision making: checking if a condition is true (in which case something should be done) but also reacting if the condition is not true (false).

- **Format:**

if (*operand relational operator operand*):

body of 'if'

else:

body of 'else'

additional statements

James Tam

If-Else Construct (2)

- **Program name:** if_else1.py

- **Example:**

```
if (age < 18):
```

```
    print ("Not an adult")
```

```
else:
```

```
    print ("Adult")
```

```
print ("Tell me more about yourself")
```

James Tam

Lesson: Read Things The Way They're Actually Stated (Instead of How You Think They're Stated)

•Example: Actual Code

```
if (age >= 18):  
    print ("Adult")  
else:  
    print ("Not an adult")  
print ("Tell me more about yourself")
```

James Tam

Lesson: Read Things The Way They're Actually Stated (Instead of How You Think They're Stated)

•Example: How One Class Interpreted The Code (Optical Illusion?)

```
if (age >= 18):  
    print ("Adult")  
else:  
    print ("Not an adult")  
    print ("Tell me more about yourself")
```

JT's tip: one way of making sure you read the program code the way it actually is written rather than how you think it should be is to take breaks from writing

James Tam

If-Else (Compound Body(2))

•**Program name:** if_else2.py

•**Example:**

```
if (income < 10000):
    print ("Eligible for social assistance")
    taxCredit = 100
    taxRate = 0.1
else:
    print ("Not eligible for social assistance")
    taxRate = 0.2
tax = (income * taxRate) - taxCredit
```

James Tam

Quick Summary: If Vs. If-Else

•**If:**

- Evaluate a Boolean expression (ask a question).
- If the expression evaluates to true then execute the 'body' of the if.
- No additional action is taken when the expression evaluates to false.
- Use when your program is supposed to react differently only when the answer to a question is true (and do nothing different if it's false).

•**If-Else:**

- Evaluate a Boolean expression (ask a question)
- If the expression evaluates to true then execute the 'body' of the if.
- If the expression evaluates to false then execute the 'body' of the else.
- Use when your program is supposed to react differently for both the true and the false case.

James Tam

An Application Of Branches

- Branching statements can be used to check the validity of data (if the data is correct or if it's a value that's allowed by the program).
- General structure:
if (error condition has occurred)
 React to the error
- Example:
if (age < 0):
 print "Age cannot be a negative value"

James Tam

Logical Operations

- There are many logical operations but the three most commonly in computer programs include:
 - Logical AND
 - Logical OR
 - Logical NOT

James Tam

Logical AND

- The popular usage of the AND applies when *ALL* conditions must be met.

- Example:

- Pick up your son AND pick up your daughter after school today.

Condition I

Condition II

- Logical AND can be specified more formally in the form of true table.

Truth table (AND)		
C1	C2	C1 AND C2
False	False	False
False	True	False
True	False	False
<i>True</i>	<i>True</i>	<i>True</i>

James Tam

Logical AND: Three Input Truth Table

Truth table			
C1	C2	C3	C1 AND C2 AND C3
False	False	False	False
False	False	True	False
False	True	False	False
False	True	True	False
True	False	False	False
True	False	True	False
True	True	False	False
<i>True</i>	<i>True</i>	<i>True</i>	<i>True</i>

James Tam

Evaluating Logical AND Expressions

- True **AND** True **AND** True
- False **AND** True **AND** True
- True **AND** True **AND** True **AND** True
- True **AND** True **AND** True **AND** False

James Tam

Logical OR

- The correct everyday usage of the OR applies when *ATLEAST* one condition must be met.
 - Example:
 - You are using additional recommended resources for this course: the online textbook OR the paper textbook available in the bookstore.
- Condition I** **Condition II**
- Similar to AND, logical OR can be specified more formally in the form of true table.

Truth table		
C1	C2	C1 OR C2
<i>False</i>	<i>False</i>	<i>False</i>
False	True	True
True	False	True
True	True	True

James Tam

Logical OR: Three Input Truth Table

Truth table			
C1	C2	C3	C1 OR C2 OR C3
<i>False</i>	<i>False</i>	<i>False</i>	<i>False</i>
False	False	True	True
False	True	False	True
False	True	True	True
True	False	False	True
True	False	True	True
True	True	False	True
True	True	True	True

James Tam

Evaluating Logical OR Expressions

- True **OR** True **OR** True
- False **OR** True **OR** True
- False **OR** False **OR** False **OR** True
- False **OR** False **OR** False **OR** False

James Tam

Logical NOT

- The everyday usage of logical NOT negates (or reverses) a statement.

- Example:

- I am finding this class quite stimulating and exciting.....*NOT!!!*

Statement

Negation of the condition

- The truth table for logical NOT is quite simple:

Truth table	
S	Not S
False	True
True	False

James Tam

Evaluating More Complex Logical Expressions

- True **OR** True **AND** True
- NOT** (False **OR** True) **OR** True
- (False **AND** False) **OR** (False **AND** True)
- False **OR** (False **OR** True) **AND** False
- NOT NOT NOT NOT** True
- NOT NOT NOT NOT** False
- NOT NOT NOT** False

James Tam

Logic Can Be Used In Conjunction With Branching

- Typically the logical operators AND, OR are used with multiple conditions:
 - If multiple conditions *must all be met* before a statement will execute. (AND)
 - If *at least one condition* must be met before a statement will execute. (OR)
- The logical NOT operator can be used to check for inequality (not equal to).
 - E.g., If it's true that the user *did not* enter an invalid value the program can proceed.

James Tam

Decision-Making With Multiple Expressions

- **Format:**
if (*Boolean expression*) *logical operator* (*Boolean expression*):
 body
- **Example:**
if (x > 0) and (y > 0):
 print ("X is positive, Y is positive")

James Tam

Forming Compound Boolean Expressions With The “OR” Operator

- Format:**

```
if (Boolean expression) or (Boolean expression):  
    body
```

- Example:**

```
if (gpa > 3.7) or (yearsJobExperience > 5):  
    print ("You are hired")
```

James Tam

Forming Compound Boolean Expressions With The “AND” Operator

- Format:**

```
if (Boolean expression) and (Boolean expression):  
    body
```

- Example:**

```
if (yearsOnJob <= 2) and (salary > 50000):  
    print ("You are fired")
```

James Tam

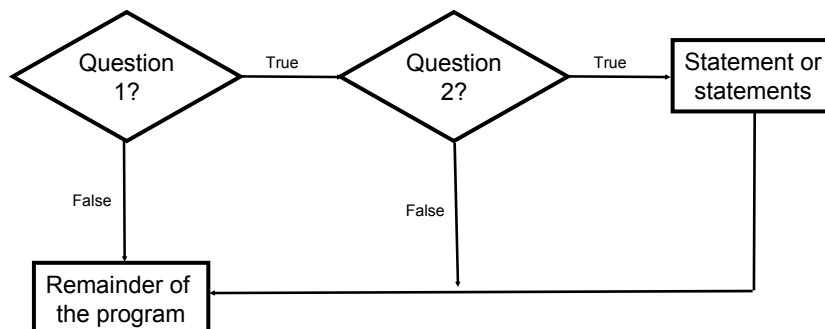

Quick Summary: Using Multiple Expressions

- Use multiple expressions when multiple questions must be asked and the result of each expression may have an effect on the other expressions:
- AND:
 - All Boolean expressions must evaluate to true before the entire expression is true.
 - If any expression is false then whole expression evaluates to false
- OR:
 - If any Boolean expression evaluates to true then the entire expression evaluates to true.
 - All Boolean expressions must evaluate to false before the entire expression is false.

James Tam

Nested Decision Making

- Decision making is dependent.
- The first decision must evaluate to true before successive decisions are even considered for evaluation.

James Tam

Nested Decision Making

- One decision is made inside another.
- Outer decisions must evaluate to true before inner decisions are even considered for evaluation.
- **Format:**

if (*Boolean expression*):

```
if (Boolean expression):
```

```
    inner body
```

← Outer body

← Inner body

James Tam

Nested Decision Making (2)

- **Example:**

```
if (income < 10000):
```

```
    if (citizen == 'y'):
```

```
        print ("This person can receive social assistance")
```

```
        taxCredit = 100
```

```
    tax = (income * TAX_RATE) - taxCredit
```

James Tam

Question

- What's the difference between employing nested decision making and a logical AND?

James Tam

Decision-Making With Multiple Alternatives

- IF
 - Checks a condition and executes the body of code if the condition is true
- IF-ELSE
 - Checks a condition and executes one body of code if the condition is true and another body if the condition is false
- Approaches for multiple (two or more) alternatives
 - Multiple IF's
 - IF-ELIF-ELSE

James Tam

Decision Making With Multiple If's

James Tam

Multiple If's: Non-Exclusive Conditions

- Any, all or none of the conditions may be true (independent)

- **Format:**

if (*Boolean expression 1*):

body 1

if (*Boolean expression 2*):

body 2

 :

statements after the conditions

James Tam

Multiple If's: Non-Exclusive Conditions (Example)

- **Example:**

```
if (num1 > 0):  
    print "num1 is positive"  
if (num2 > 0):  
    print "num2 is positive"  
if (num3 > 0):  
    print "num3 is positive"
```

James Tam

Multiple If's: Mutually Exclusive Conditions

- At most *only one* of many conditions can be true
- Can be implemented through multiple if's
- **Example:** The name of the complete online program is: "inefficient.py"

**Inefficient
combination!**

```
if (gpa == 4):  
    letter = 'A'  
if (gpa == 3):  
    letter = 'B'  
if (gpa == 2):  
    letter = 'C'  
if (gpa == 1):  
    letter = 'D'  
if (gpa == 0):  
    letter = 'F'
```

James Tam

Decision Making With If-Elif-Else

James Tam

Multiple If-Elif-Else: Mutually Exclusive Conditions

•Format:

if (*Boolean expression 1*):

body 1

elif (*Boolean expression 2*):

body 2

 :

else

body n

statements after the conditions

James Tam

Multiple If, Else-If's: Mutually Exclusive Conditions (Example)

- **Example:** The name of the complete online program is: "efficient.py"

```
if (gpa == 4):  
    letter = 'A'  
  
elif (gpa == 3):  
    letter = 'B'  
  
elif (gpa == 2):  
    letter = 'C';  
  
elif (gpa == 1):  
    letter = 'D'  
  
elif (gpa == 0):  
    letter = 'F'  
  
else:  
    print ("GPA must be one of '4', '3', '2', '1' or '1'")
```

This approach is more efficient when at most only one condition can be true.

The body of the else executes only when all the Boolean expressions are false. (Useful for error checking/handling).

James Tam

Recap: What Decision Making Constructs Are Available In Pascal/When To Use Them

Construct	When To Use
If	Evaluate a Boolean expression and execute some code (body) if it's true
If-else	Evaluate a Boolean expression and execute some code (first body 'if') if it's true, execute alternate code (second body 'else') if it's false
Multiple if's	Multiple Boolean expressions need to be evaluated with the answer for each expression being independent of the answers for the others (non-exclusive). Separate code (bodies) can be executed for each expression.
If-elif-else	Multiple Boolean expressions need to be evaluated but zero or at most only one of them can be true (mutually exclusive). Zero bodies or exactly one body will execute. Also it allows for a separate body (else) to execute when all the if-elif Boolean expressions are false.

James Tam

Recap: When To Use Compound And Nested Decision Making Constructs (2)

Construct	When To Use
Compound decision making	More than one Boolean expression must be evaluated before some code (body) can execute. All expressions must evaluate to true (AND) or at least one expression must evaluate to true (OR).
Nested decision making	The outer Boolean expression must be true before the inner expression will even be evaluated. (Inner Boolean expression is part of the body of the outer Boolean expression).

James Tam

Testing Decision Making Constructs

- Make sure that the body of each decision making construct executes when it should.
- Test:
 - 1) Obvious true cases
 - 2) Obvious false cases
 - 3) Boundary cases

James Tam

Testing Decisions: An Example

```
num = int(input("Type in a value for num: "))
if (num >= 0):
    print ("Num is non-negative.")
else:
    print ("Num is negative.")
```

James Tam

Avoid Using Real Values When An Integer Will Do

Program name: real_test.py

```
num = 1.0 - 0.55
if (num == 0.45):
    print ("Forty five")
else:
    print ("Not forty five")
```

James Tam

Problem Solving: Branches

- Write a program that converts percentages to one of the following letter grades: A (90 – 100%), B (80 – 89%), C (70 – 79%), D (60 – 69%), F (0 – 59%).
- The percentage score should come from the user.
- After determining the letter grade, the original percentage and its corresponding letter should be displayed.
- The program should display an error message for percentages outside of the above ranges.

James Tam

Outline Of Solution

- Get the percentage score.
- Determine the letter grade
- Display the result

James Tam

Developing A Solution: Start With The Easier Parts

```
percentage = 0.0
letter = ''
percentage = input("Enter the percentage score: ")

# Determine letter grade: don't look at the solution until you've tried to
# come up with a solution yourself.

print("Percentage: ", percentage, "%\n\t Letter: ", letter)
```

James Tam

Determining The Correct Ranges

- Before directly implementing a solution (i.e., writing Python code) make sure that you have a clear idea of what's entailed.
- Depending upon the complexity of the problem this process may be formal (e.g., drawing diagrams, writing text descriptions, using detailed and specific notations etc.) or informal (e.g., going over the solution in your head).
- Also if your solution is not working (contains errors) then return back to the process of specifying what's entailed but do it more formally and in a more detailed form.

James Tam

Determining Ranges: A Solution (Don't Look Until You've Tried It Yourself)

```
if (percentage <= 100) and (percentage >= 90):
    letter = 'A'
elif (percentage <= 89) and (percentage >= 80):
    letter = 'B'
elif (percentage <= 79) and (percentage >= 70):
    letter = 'C'
elif (percentage <= 69) and (percentage >= 60):
    letter = 'D'
elif (percentage <= 59) and (percentage >= 0):
    letter = 'F'
else:
    print "Percent score is outside the allowable range (0 - 100%)"
    letter = 'Error'
```

Question: What happens if logical “OR” is employed instead of “AND”

James Tam

Decision Making: Checking Matches

- Python provides a quick way of checking for matches within a set.
 - E.g., for a menu driven program is the user's response one of the values in the set of valid responses.

Format:

(Strings)

```
if <string variable> in "<string1> <string2>...<stringn>":
    body
```

(Numeric)

```
if <numeric variable> in (<number1>, <number2>,...<numbern>":
    body
```

James Tam

Decision Making: Checking Matches (2)

Example:

(String):

```
if answer in "password1 password2 password3":
```

```
    print "correct"
```

```
else:
```

```
    print "incorrect"
```

(Numeric):

```
if num in (1, 2, 3):
```

```
    print "in set"
```

James Tam

After This Section You Should Now Know

- What are the three decision making constructs available in Python:
 - If
 - If-else
 - If-elif-else
 - How does each one work
 - When should each one be used
- Three logical operations:
 - AND
 - OR
 - NOT
- How to evaluate and use decision making constructs:
 - Tracing the execution of simple decision making constructs
 - How to evaluate nested and compound decision making constructs and when to use them

James Tam

You Should Now Know (2)

- How the bodies of the decision making construct are defined:
 - What is the body of decision making construct
 - What is the difference between decision making constructs with simple bodies and those with compound bodies
- What is an operand
- What is a relational operator
- What is a Boolean expression
- How multiple expressions are evaluated and how the different logical operators work
- How to test decision making constructs
