Introduction To Computer Science

**In this section you will get
an overview of some areas
of Computer Science.**

Introduction To Computer Science

• What is Computer Science?

Introduction To Computer Science

•What is Computer Science?

Introduction To Computer Science

•Computer Science is about problem solving

Graphics

Interactive displays

Robotics: acceptance of domesticated robots

Artificial Intelligence

Computer Science Is Not The Same As Computer Programming

•Computer Science does require the creation of computer programs ('programming') but goes beyond that.

Computer Science

Programming

Some Areas Of Study And Research In Computer Science

•Human-Computer Interaction

•Computer Graphics

•Information Visualization

•Databases

•Computer theory

•Computer networking and distributed systems

•Artificial Intelligence

•Computer Vision

•Software Engineering

•Games programming

This list provides only a brief introduction to the different areas of Computer Science and is far from comprehensive:
For a more updated list: http://www.cpsc.ucalgary.ca/Research/

# Some Areas Of Study And Research In Computer Science

- **Human-Computer Interaction**
- **Computer Graphics**
- Information Visualization
- Databases
- Computer theory
- Computer networking
- **Artificial Intelligence**
- **Computer Vision**
- **Software Engineering**
- **Games programming**

This list provides only a brief introduction to the different areas of Computer Science and is far from comprehensive:
For a more updated list: http://www.cpsc.ucalgary.ca/Research/
Human-Computer Interaction (HCI)

- Most of Computer Science deals with the 'technical' side of computers.
Run computers faster!

Make computers store more information!!

Increase the networking capabilities of computers!!!

- These technical issues (and others) are all very important but something is still missing...

For more information: http://grouplab.cpsc.ucalgary.ca/ or http://pages.cpsc.ucalgary.ca/~ehud/Research.html

Human-**Computer** Interaction

•Most of Computer Science deals with the 'technical' side of computers.

Run computers faster!

Make computers store more information!!

Increase the networking capabilities of computers!!!

•These technical issues (and others) are all very important but something is still missing...

Human-Computer Interaction

•...but don't forget about the other side of the relationship.

•No matter how powerful the computer and how well written is the software, if the user of the program can't figure out how it works then the system is useless.

•Software should be written to make it as easy as possible for the user to complete their task. (Don't make it any harder than it has to be).

•This is just common sense and should/is always taken into account when writing software?

Human-Computer Interaction: Not Just Common Sense Information (3)

Eye Candy
? Are you sure you want to delete 'Ridges'?
OK

Cancel   Help
Click this to display an overview of this dialog box, idiot.
For Help on an item, click ? at the top of the dialog box, and then click the item.
AutoCAD Mechanical

Error Deleting File
Cannot delete 016: There is not enough free disk space.
Delete one or more files to free disk space, and then try again.
OK
Windows 95

Human-Computer Interaction: Not Just Common Sense Information (4)

Determining Requirements For Software

•Requirements are typically a list of 'features' or operations that the software performs.
- E.g., for a word processor it could include saving, printing, spell checking etc.

•While having the proper functionality is important it's not sufficient.
- Although a program might include a particular feature if users cannot find or figure out how to use the feature then it's useless.

Ways Of Including The 'Human' In The Development Process

•Get in touch with real people who will be potential users of your system.

•Spend time with them discussing how the system might fit in to their work.

•Learn about the user's tasks:
- Articulate concrete, detailed examples of tasks they currently complete or those that they want to complete (ones that they want to do but can't do

Ways Of Including The 'Human' In The Development Process (2)

1. At the very least, talk to users
   - It's surprising how many designers don't!

2. Contextual Inquiries
   - Key characteristics:
     - **Interview** users **in their usage place** (e.g., office), **as they are going about their normal routine** (e.g., using your system while working)
   - Purpose:
     - Used to discover the user's culture, requirements, expectations, etc.

Ways Of Including The 'Human' In The Development Process (3)

- 3) Create prototypes
  - It's hard to comment on something that doesn't yet exist

  - Users are good at giving feedback for something that is even partially built

James Tam

Computer Graphics

•Concerned with producing images on the computer.

Gran Turismo © Sony

Computer Graphics: Issues

•How to make the images look "real"?

From http://klamath.stanford.edu/~aaa/
Computer Graphics: Highly Mathematical

•Highly mathematical

Computer Graphics: Still A Long Way To Go

• "Even though modeling and rendering in computer graphics have been improved tremendously in the past 35 years, we are still not at the point where we can model automatically, a tiger swimming in the river in all it's glorious details." [1]

[1] From "The Tiger Experience" by Alain Fournier at the University of British Columbia

Artificial Intelligence

•Trying to build technology that appears to be 'intelligent'

•What makes a person smart?

"*We don't truly understand what intelligence is, but we hope we know it when we see it.*" – Kenneth Hoganson (Concepts in Computing): Jones and Bartleett 2008)

For more information: http://pages.cpsc.ucalgary.ca/~jacob/AI/ or
http://pages.cpsc.ucalgary.ca/~denzinge/

James Tam

Artificial Intelligence (2)

• Approaches:
  1) Trying to simulate a person ^(strong equivalence)
 2) Trying to simulate what the person can do

James Tam

Artificial Intelligence (2)

- Approaches:
  1) Trying to simulate a person (strong equivalence)

Hasta la vista baby!

  2) Trying to simulate what the person can do (weak equivalence)

# Fields Of Artificial Intelligence

•Machine learning

•Experts systems

•Neural networks

•Fuzzy logic

Machine Learning

- The focus is on designing a computer that has the ability to learn and adapt to new situations (rather than just apply a fixed set of rules).

James Tam

Expert Systems

- The focus is on capturing the knowledge of a human expert as a set of rules stored in a database.

- The expert system can then answer questions, diagnose problems and guide decision making.

- Example applications: medicine, computer repair

James Tam

Neural Networks

•The focus is on building structures that function the way that neurons (and their connections in the brain) function.

•(Simplified overview):
  - Neurons take electrical pulses and input and send electrical pulses as output.
  - A required level of input is required before the output is fired.

•This approach has been applied to problems which involve pattern recognition (e.g., visual, voice).

Fuzzy Logic

•People can make decisions when faced with uncertainty.

•The standard logic of computer programs (true/false) cannot be easily applied when relationships can be applied with only a degree of probability.
  - Standard computer program:
    if X then Y
    e.g., if temperature >= 50 then decrease temperature

•Fuzzy logic is reasoning with probabilities
  - Fuzzy logic programs:
   If close enough to X then Y
    E.g., if temperature is too hot then make temperature less hot

Artificial Intelligence: Mission Accomplished?

•How do we know we have a "smart machine"?
  - The Turing test

Artificial Intelligence: Won't Be Created In The Foreseeable Future

•Much work still needs to be done

Photo from www.startrek.com © Paramount

Computer Vision

- The focus is on interpreting and understanding visual information.
 - Hand writing recognition: six?

  - Analyzing digital video: studying running styles

James Tam

Software Engineering

Dilbert © United Features Syndicate

- Concerned with employing systematic ways of producing good software on time and within budget.

- A typical person can only hold ~7 concepts in their mind at a time.
  - A typical computer program consists of more than 7 'parts'.

- Consequently mechanisms for dealing with this complexity are needed.
  - Top down approach break a large (hard to conceive) problem into smaller more manageable parts.

James Tam

Software Engineering (2): Techniques

•Extreme programming

•Agile development

•Design patterns

Extreme Programming

•The focus is on developing prototypes very quickly with extensive testing and user communication.

•With the traditional approach to software development where specifications (what the software is supposed to do) is determined at the start and fixed throughout the project.

•With extreme programming specifications can and will change.
  - (It's argued that it's impossible to correctly envision all the issues associated with a large project at the onset).
  - There is however greater risk that the software will run into 'dead ends' and it has to be redesigned.

Agile Programming

•Related to extreme programming.

•The focus is on reducing risk by producing a new 'iteration' of the software in a short period of time (~1 – 4 weeks).

•The project is then evaluated.
  - The emphasis is on real time and face-to-face communication between developers over written documentation.
  - Everyone associated with the project is brought together: developers, software testers, project managers and end users.
  - Benefit: reduced development time with fewer misunderstandings.

•Contrast with traditional development: formal processes are followed such as heavily documenting program code.

Agile Programming (2)

•Traditional approaches work well for extremely large projects that require a high degree of reliability.

•Agile programming works well for smaller (although still large) projects where having a shorter development time is crucial.

Design Patterns

- A design pattern: a way of implementing and part of the software that has been shown to be been sound under a number of different contexts.

- Design patterns are a way of documenting past approaches to a problem that have shown be successful.

Games Programming

- Pulls together many areas of Computer Science

- The University of Calgary was the first Canadian university to offer this area of study.
