

## Programming intro: Exercise 1 (creating/running a program, variables basic input and output)

---

Write a python program that prompts for the person's full name. It will then display a greeting which includes the name typed in the following format:

Hello *<User entered name>* !

```
Type in your full name (given names & then last name): James Tam
Hello James Tam !
```

(Solution is on the next page)

JT's hint: Before looking at the answer make a real attempt at providing an answer. If you are drawing a blank then it indicates that you need to study the material from lecture as well as looking at the in class notes that you should be taking as you are following along in class. You will get far more out of the process if you try it out as if you were writing an actual exam question rather than just directly looking at the answer.

#New concepts:

# 1) Creating/running a python program

# 2) Declaring/using variables

# 3) Text input and output

fullName = input("Type in your full name (given names & then last name): ")

print("Hello",fullName,"!")

#Better but not mandatory

print("Hello",fullName,end="!")
