

**Exercise 1:**

- Write a program that will ask the user for their total income.
- The program should declare and use a named constant to specify the tax rate of 10%.
- When income is positive tax will be deducted at the specified rate.
- There's no tax for income that isn't positive.
- The program will then display: total income, the total amount of tax to be paid and income after taxes have been deducted.
- **Solution:** `tax_version1.py`
